## Conventions used in this manual

To give this manual an easily understood layout and to emphasize important information, the following typographical styles and symbols are used:

### Styles

| Style                   | Function  | Example     |
|-------------------------|---|-------------|
| Bold                    | Programs, inputs or highlighting important things | <b>bold</b> |
| Courier                 | Code listings etc.                                | Input       |
| Upper case              | Register  | REGISTER    |
| Italics                 | Modes, fields                                     | <i>Mode</i> |
| Parentheses and/or blue | Links   | (Link)      |

Table 2: Styles

### Symbols

**Note** \_\_\_\_\_ This symbol highlights important information.

**Caution** \_\_\_\_\_ This symbol highlights important instructions. You have to follow these instructions to avoid malfunctions.

**www** \_\_\_\_\_ This symbol highlights URLs for further information. The URL itself is shown in blue.

Example:

<http://www.alliedvisiontec.com>

## Before operation

The FirePackage SmartView Manual is the guide to the installation of the software and the operation of AVT cameras with SmartView.

**Note**

Please read through this manual carefully before operating AVT cameras with SmartView.

# AVT SmartView for FirePackage

In this manual FirePackage means both: 32-bit version as well as 64-bit version.

## Hardware conditions

- PC or laptop with built-in IEEE 1394 interface
- IEEE 1394 adapter (OHCI) card for PCI bus or PCI Express bus or PC card or ExpressCard with IEEE 1394 port(s)

**Note**

AVT offers a wide range of IEEE 1394 adapters, both 1394a or 1394b for different requirements.

## FireWire hot-plug and screw-lock precautions

**Caution**

### Hot-plug precautions

- Although FireWire devices can **theoretically** be hot-plugged without powering down equipment, **we strongly recommend turning the computer power off, before connecting a digital camera** to it via a FireWire cable.
- **Static electricity or slight plug misalignment during insertion may short-circuit and damage components.**
- The physical ports **may be damaged by excessive ESD** (electrostatic discharge), when connected under powered conditions. It is good practice to ensure proper grounding of computer case and camera case to the same ground potential, before plugging the camera cable into the port of the computer. This ensures that no excessive difference of electrical potential exists between computer and camera.

### Screw-lock precautions

- Also, all AVT 1394b camera and cables have **industrial screw-lock fasteners**, to insure a tight electrical connection that is resistant to vibration and gravity.
- **We strongly recommend using only 1394b adapter cards with screw-locks.**

## Supported operating systems

... for **FirePackage**:

- Windows XP (32 bit and 64 bit)
- Windows Vista (32 bit and 64 bit)
- Windows 7 (32 bit and 64 bit)

**Note**

The AVT FirePackage includes a special IEEE 1394 device driver from INTEK suitable for all AVT cameras which replaces the MS 1394 driver stack completely.

## Overview FirePackage

- Install IEEE 1394 adapter (if PC or laptop does not have an IEEE 1394 port)
- Install **FirePackage** (incl. SmartView)
- Start SmartView
- Connect camera to PC or laptop and ensure that the camera is powered
- License will automatically be read out from your AVT camera (in case of problems, contact AVT support)
- Get your first image with SmartView
- Problems? Read Chapter [Troubleshooting](#) on page 25.

## Installing IEEE 1394 adapter

**Note**

When you install FirePackage the SmartView program will automatically be installed.

1. PC: Install the IEEE 1394 adapter according to the instructions you got from your adapter manufacturer.  
Laptop: Insert the IEEE 1394 PC Card into your laptop. Connect external power supply to the adapter to power the camera or power the camera via Hirose connector.  
Windows XP/ Windows Vista/Windows 7 will detect the hardware automatically and installs a Windows 1394 driver.

## Installing FirePackage (incl. SmartView program)

1. Download AVT FirePackage from the AVT website.
  2. To start the installation of FirePackage unzip **AVT FirePackage x.y.zip**
  3. Double-click on AVTFirePackage\_3\_0.exe.  
A wizard will guide you through the installation. To go on click **Next** in each window.
  4. You are asked to choose a directory: Accept the option shown or type another one. Click **Next**.
  5. Activate all 3 check boxes. Click **Next** to start installation.  
**AVT FirePackage** is being installed.  
The INTEK window appears.
  6. Now install the driver for the IEEE 1394 adapter: for each card to be used with **FirePackage**, activate the check box.
  7. Click **Install**.
  8. Ignore the message box (Microsoft non-certified driver) and continue the installation.  
A wizard will guide you through the installation. To continue click **Next** in each window.  
A window appears: FirePackage has been successfully installed.
  9. Click **Close**.
- Now the **FirePackage** and the **SmartView** Program are installed on your PC or laptop.

## Turn off PC or laptop

1. Close all programs.
2. Shutdown Windows.
3. Turn off PC or laptop.

## Connecting camera to PC or laptop

1. Insert one end of the FireWire cable into your 1394 adapter or 1394 PC card.
2. Insert the other end of the FireWire cable into your camera.
3. Check that the camera is powered (green LED ON)

## Switch on PC or laptop

1. Switch on PC or laptop.
2. Wait until Windows has started.

## Starting SmartView

The **SmartView** program:

- enables access to all connected IEEE 1394 cameras
  - supports almost all smart features of the AVT cameras.
1. Click **Start → Programs → Allied Vision Technologies → FirePackage → AVT\_SmartView**  
The **SmartView** window opens.
  2. Here you can see all 1394 buses and PCI slots (e.g. 0x040800).

## Licensing

You need a license to run the FirePackage. This license is embedded in each AVT camera. It will be read out with the help of the license file **LICENSE.TXT**.

**Note**

Newer versions of **AVT FirePackage**

(> 2V6) use additional registry keys for supplying alternative names and positions for the license file to be stored.

**Note**

For detailed licensing infos read:

- **AVT FirePackage User Guide**, Chapter **Licensing**

## First steps with SmartView

1. After connecting the camera with your PC or laptop, start **SmartView** program. In the **SmartView** entry window you see all FireWire adapters or cards installed in your PC.
2. In the **SmartView** entry window open all trees by clicking on the [+] button. Search for your camera and double-click on the camera entry.

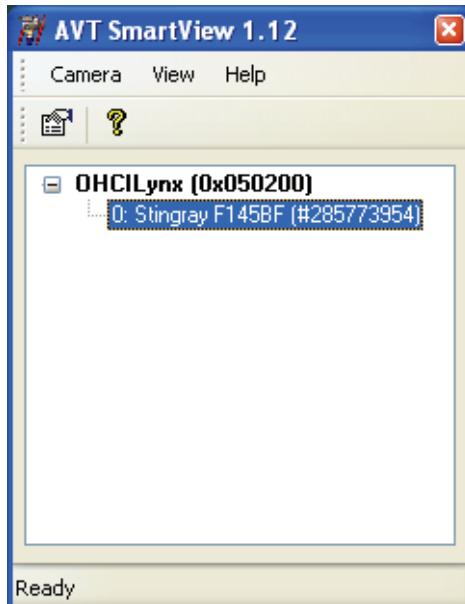

Figure 1: SmartView entry window: example of Pike F-145B fiber

3. The **SmartView** main window opens and usually one first image is shot automatically.

## Overview: SmartView entry window

The menus and icons of the SmartView entry window are explained in the following tables:

| Icon  | Function         | Description  |
|---|------------------|--|
|  | General settings | Opens the <b>General settings</b> window (see <a href="#">Table 5: SmartView entry window: General settings</a> on page 23)<br>Here you can adjust settings for connecting 1394 cards to the 1394 bus, image type settings and camera view settings. |
|  | Information      | Shows version and copyright information of AVT SmartView for FirePackage   |

Table 3: SmartView entry window: toolbar

| Menu          | Submenu   | Shortcut      | Description   |
|---------------|---|---------------|---|
| <b>Camera</b> | Open/Close view   | Ctrl+0, Enter | Opens or closes a viewer window (main window)   |
|               | Initialize the camera   |               | Initializes the selected camera   |
|               | Soft reset  |               | Resets the selected camera  |
|               | Update firmware...  |               | Updates the firmware of the Guppy/Guppy PRO/Pike/Stingray camera via 1394 bus<br>Read the application note: <b>How to update Guppy/Guppy PRO/Pike/Stingray firmware</b> at AVT website (Support → Knowledge Base; search for <i>firmware update</i> ).<br>For other cameras: Read the chapter <b>Firmware update</b> of the <b>Technical Manual</b> or contact your local dealer. |
|               | Format 7 mapping...   |               | Only Pike/Stingray/Guppy PRO: Allows mapping of all possible Format_7 settings to F7M1..F7M7 (see <b>Pike/Stingray/Guppy PRO Technical Manual</b> , Chapter <b>Binning and sub-sampling access</b> )  |
|               |  Settings... | Alt+E         | Opens the <b>General settings</b> window (see <a href="#">Table 5: SmartView entry window: General settings</a> on page 23)<br>Here you can adjust settings for connecting 1394 cards to the 1394 bus, image type settings and camera view settings.  |
|               | Exit  | Alt+X         | Quits the application   |
| <b>View</b>   | Toolbar   |               | Shows or hides the toolbar (see <a href="#">Table 3: SmartView entry window: toolbar</a> on page 21)  |
|               | Status bar  |               | Shows or hides the status bar   |
| <b>Help</b>   | About AVT SmartView...  |               | Shows version and copyright information of AVT SmartView for FirePackage  |

Table 4: SmartView entry window: **menus**

In SmartView entry window click on **Camera** →  **Settings**.

The **General settings** window opens.

| Section                    | Check box / combo box/ list  | Description   |
|----------------------------|--|---|
| Enable initial card states | <input type="checkbox"/> Enable initial card states  | This function is useful, if you have more than one card installed and several cameras.<br>Activate this check box and disable cards you don't use and set your <i>working</i> card to <b>False</b> , so that connected cameras are shown automatically.   |
|                            | Card ID list   | Lists all 1394 cards (connected to your PC/Laptop) with their ID number.<br>To disable a card, set the <b>Disabled</b> parameter to <b>True</b> .<br>To open the bus when SmartView is started, set the <b>AutoOpen</b> parameter to <b>True</b> . All connected 1394 cameras of this card will be searched and opened automatically. |
| Camera                     | <input type="checkbox"/> Automatically open camera views on startup                                  | Activate this check box to view all connected cameras automatically, when corresponding card is opened.   |
|                            | <input type="checkbox"/> Selected cameras only   | Activate this check box to show only selected cameras from the list, when SmartView is started.<br>The list shows all cameras, that have been connected to your PC/laptop and have been opened with SmartView.<br>Select one or more cameras by clicking on the camera name.  |
| Image file type            | <input type="button" value="▼"/><br><input type="checkbox"/> Default type used by 'Save' & 'Save as' | Choose your standard image file type for the <b>Save</b> and <b>Save as</b> operation. The following types are available: bmp, jpg, gif, tif, png   |
|                            | <input type="checkbox"/> Override extension entered by the user                                      | If you activate this check box, all settings made within the <b>Save</b> and <b>Save as</b> command are ignored.  |

Table 5: SmartView entry window: **General settings**

| Section              | Check box / combo box/ list                                       | Description   |
|----------------------|---|---|
| Camera view settings | <input type="checkbox"/> Always scale image to view size          | Standard setting for each window. Activating this check box will scale the camera image to the SmartView viewer window size. Otherwise the camera image size is not scaled to the viewer window size. |
|                      | <input type="checkbox"/> Resize camera view on resolution changes | Standard setting for each window. Activate this check box to adapt the viewer window to each resolution change of the image size (fixed modes) or the AOI size (Format 7 settings).                   |

Table 5: SmartView entry window: **General settings**

## Troubleshooting

If the image is completely black, completely white or the image quality is poor, then try the following steps:

- If not done yet, remove the lens cap.
- If the image is black, open the aperture. If the image is white, close the aperture.
- If the image quality is poor, try changing the focus.

If you still don't get any image at all, then try the following steps:

- Check the FireWire plug of your camera and PC/laptop.
- Check the LEDs on the back of the camera.

## Icon bar of SmartView (main window)

The following table shows all functions of **SmartView (main window)** available via the icon bar.

| Icon  | Function      | Description   |
|---|---------------|---|
|  | Save          | Saves the image(s) to the file you have previously set with <b>Save as...</b> command. Also possible during acquiring images (takes more time).   |
|  | Edit Settings | <p>Opens a settings window. Here you can adjust the settings for the standard registers, e.g. exposure time or gain (IIDD specification) and the settings for advanced AVT features.</p> <p>The following tabs are available:</p> <ul style="list-style-type: none"> <li>• Format</li> <li>• Ctrl 1</li> <li>• Ctrl 2</li> <li>• Ctrl 3 (only for certain color cameras)</li> <li>• Trig/IO</li> <li>• LUT/Shdg.</li> <li>• Adv 1</li> <li>• Adv 2</li> <li>• Adv 3 (not all cameras)</li> <li>• Adv 4 (only Stingray)</li> <li>• CMOS (only for cameras with CMOS sensor)</li> </ul> <p>Some settings can only be changed when the camera is in idle mode.</p> |

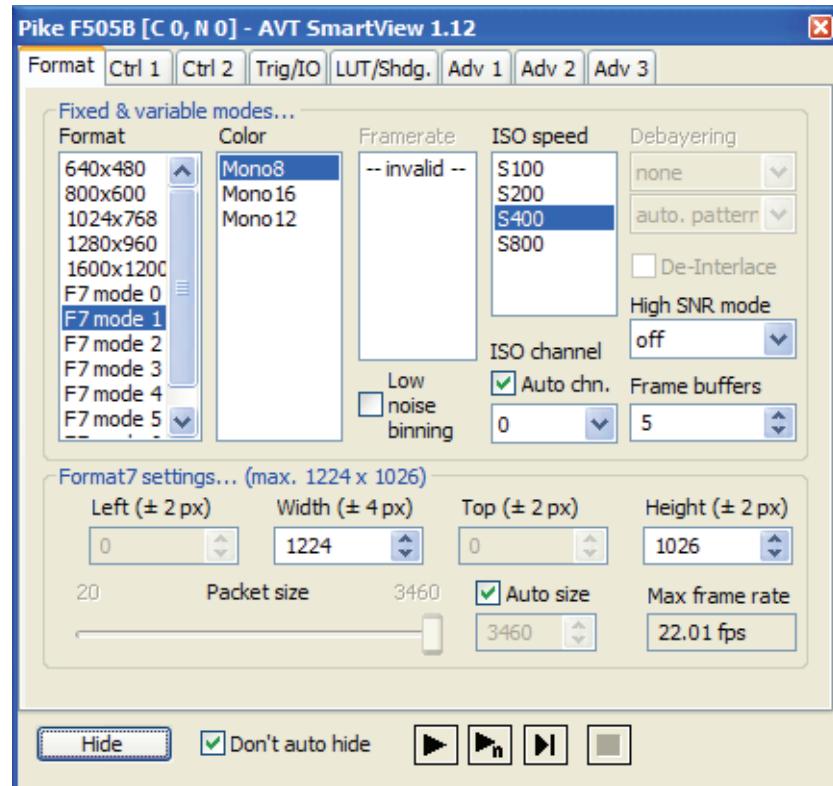

Table 6: Functions of SmartView available via **icon bar**

| Icon  | Function                  | Description  |
|---|---------------------------|--|
|    | Direct register access    | Opens a window (Direct Access dialog box)<br>For an example see <a href="#">Figure 3: SmartView: example of DirectAccess dialog (Marlin F-080C-30fps)</a> on page 30.<br>Enables you to access all features by their address and to change the register of the AVT camera directly. All settings can be changed while the camera is running, although some features will only take effect after you stop and restart the camera. |
|    | Start iso                 | Acquires <b>images continuously</b>  |
|    | Multi-shot                | Acquires multi images as set in the <b>Edit Settings → TriggerI/O tab → Multishot counter</b> combo box  |
|   | One-shot                  | Acquires <b>only one image</b>   |
|  | Stop                      | Stops acquiring images (free-run or multi-shot)  |
|  | Record                    | Records images to individual file names you have set under <b>File → Recording options...</b><br>This function can also be used during image acquisition.  |
|  | Display image coordinates | Displays the image coordinates in a yellow bubble box on top of mouse cursor<br>   |

Table 6: Functions of SmartView available via **icon bar**

| Icon  | Function                                   | Description  |
|---|--|--|
|    | Display image coordinates and image values | Displays the image coordinates and the image values (intensity) in a yellow bubble box on top of mouse cursor<br><br><br>color image      b/w image |
|    | Display format options in status bar       | Displays the format options in the status bar.<br>Example: 2080x1540x8 (RAW8)  |
|    | Increase zoom factor                       | Increases the image zoom factor in 0.1x steps (0.1x, 0.2x, ..., 0.9x) and 1.0x steps (1.0x, 2.0x, ..., 32.0x)  |
|   | Show original image size                   | Displays the image in original image size (zoom=1.0x)  |
|  | Decrease zoom factor                       | Decreases the image zoom factor in 1.0x steps (32.0x, 31.0x, ..., 2.0x, 1.0x) and in 0.1x steps (0.9x, 0.8x, ..., 0.1x)  |
|  | Quick read settings from file              | Reads settings from file to which you have written your settings.  |
|  | Quick write settings to file               | Writes settings to the file you have chosen.   |
|  | About                                      | Shows version number, copyright information and link to Allied Vision Technologies:<br><a href="http://www.alliedvisiontec.com/">http://www.alliedvisiontec.com/</a>   |

## Menu structure of SmartView (main window)

| Menu | Submenu   | Description   |
|------|---|---|
| File |  Save Ctrl+S | Saves the image(s) to the file you have previously set with <b>Save as...</b> command.  |
|      | Save as... F12  | Click here to save an image to hard disk or network drive. Choose file format (BMP, JPEG, GIF, TIFF, PNG) and directory. After that you can save an image to this file by clicking on <b>Save</b> .   |
|      | Recording options...  | Click here to configure the recording options. After that your are able to save images in streaming format, that means one file with a successive numbering per image.<br>See Chapter <a href="#">Streaming images: recording options</a> on page 70. |
|      | <input checked="" type="checkbox"/> Use deep images Ctrl+Shift+P                              | Allows to use images with more than 8 bit (depending on camera model).<br>See Chapter <a href="#">Using deep images (only MON012/16 mode or RAW12/16 color mode)</a> on page 71.  |
|      | Exit Alt+X  | Click here to exit main window of SmartView.  |

Table 7: Functions of SmartView available via **menu**

| Menu          | Submenu   | Description   |
|---------------|---|---|
| <b>Camera</b> | ▶ Free-run Alt+R  | Acquire continuous images.  |
|               | ▶n Multi-shot Alt+M   | Acquire n images.   |
|               | ▶ One-shot Alt+G  | Acquire one image.  |
|               | ■ Stop Esc  | Stop the free-run or multi-shot modus.  |
|               | ● Record Ctrl+R   | Record individual images according to the settings you have made in <b>File → Recording options...</b> . See Chapter <a href="#">Saving and streaming images</a> on page 68.  |
|               | Settings →  Settings dialog Alt+E              | Opens the <b>Settings</b> dialog. <ul style="list-style-type: none"> <li>For <b>short overview</b> see Chapter <a href="#">Edit settings window (for specialists)</a> on page 37.</li> <li>For <b>deep description</b> on complex, difficult to understand settings see Chapter <a href="#">Operating AVT cameras with SmartView</a> on page 63.</li> </ul> |
|               | Settings →  Quick Read settings Ctrl+Shift+R   | Reads settings from file to which you have written your settings.   |
|               | Settings →  Quick Write settings Ctrl+Shift+W | Writes settings to the file you have chosen.  |
|               | Settings → Select Settings file...  | Choose a file where your settings will be stored.   |
|               | Settings → Read Settings from external file...  | Choose an external file from which the stored settings will be read.  |
|               | Settings → Write Settings to external file...   | Choose an external file to which your settings will be stored.  |
|               | Settings → <input checked="" type="checkbox"/> Search for camera by GUID  | Searches by camera ID; Default: activated   |
|               |  Direct access dialog Alt+D                  | Opens a window (Direct Access dialog box) Enables you to access all features by their address and to change the register of the AVT camera directly.<br>All settings can be changed while the camera is running, although some features will only take effect after you stop and restart the camera.  |
|               | Options → <input checked="" type="checkbox"/> Automatically load settings on camera open  | Activate check box to load settings automatically when the camera is opened.  |
|               | Options → <input checked="" type="checkbox"/> Automatically save settings on camera close                                       | Activate check box to save settings automatically when camera is closed.  |
|               | Options → <input checked="" type="checkbox"/> Start Free-Run automatically on camera open                                       | Activate check box to start free-run automatically when the camera is opened.   |
|               | Options → <input checked="" type="checkbox"/> Start One-Shot on camera open   | Activate check box to start one-shot when the camera is opened.   |

Table 7: Functions of SmartView available via **menu**

## Edit settings window (for specialists)

### Where to find

SmartView (main window):  Edit settings

### Overview: Edit settings window

#### Note

Display of tabs depends on camera types.

If a camera does not have tab-specific features implemented, the corresponding tab will not be displayed.

Depending on camera type the following tabs may be displayed:

- **Format** tab
- **Ctrl 1** tab
- **Ctrl 2** tab
- **Ctrl 3** tab  
(only Pike/Stingray color cameras and Guppy interlaced color cameras)
- **Trig/IO** tab
- **LUT/Shdg.** tab
- **Adv 1** tab
- **Adv 2** tab
- **Adv 3** tab
- **Adv 4** tab
- **CMOS** tab (only CMOS cameras)

## Format tab descriptions

| Section   | Check box/combo box/list/slider | Description  |
|---|---------------------------------|--|
| Fixed & variable modes...<br>[to be continued on next page] | Format                          | <p>Lists the <b>fixed resolutions</b> and <b>Format_7 modes</b> of the camera model.</p> <p>Depending on the camera model the following formats may be available:</p> <ul style="list-style-type: none"> <li>• Fixed formats           <ul style="list-style-type: none"> <li>– 320x240</li> <li>– 640x480</li> <li>– 800x600</li> <li>– 1024x768</li> <li>– ...</li> </ul> </li> <li>• Format_7 modes           <ul style="list-style-type: none"> <li>– F7 mode 0</li> <li>– F7 mode 1</li> <li>– ...</li> </ul> </li> </ul> |
|   | Color                           | <p>Lists the available <b>color modes</b> of the selected fixed format / Format_7 mode.</p> <p>Depending on the camera model and the selected resolution / F7 mode the following color modes may be available: Mono8, YUV411, YUV422, RGB8, RAW8, RAW16, RAW12...</p>  |
|   | Framerate                       | <p>Lists available <b>frame rates in fixed modes</b>.</p> <p>List is invalid for Format_7 modes.</p>   |
|   | ISO speed                       | <p>Lists available <b>ISO speeds</b>.</p> <p>1394a: S100, S200, S400<br/>1394b: additional S800</p> <p>The camera will use this speed for the video data transmission, async. communication may use another speed. See Submenue <a href="#">Set async speed</a> on page 35.</p>  |
|   | Debayering                      | <p>See Chapter <a href="#">Debayering algorithms</a> on page 63.</p> <p>⇒ Debayering is a SmartView feature, but not a camera feature.</p>   |
|   | High SNR mode                   | <p>Choose number of images for <b>High SNR mode</b>. This is an image averaging function.</p> <p>See <a href="#">Pike/Stingray Technical Manual</a>, Chapter <b>High SNR mode (High Signal Noise Ratio)</b></p>  |

Table 8: SmartView Edit settings: **Format** tab

| Section                                  | Check box/combo box/list/slider  | Description  |
|--|--|--|
| Fixed & variable modes...<br>[continued] | ISO channel<br>   | Set no. of ISO channels. (This is a 4-bit address to identify the source of a video data stream). Normally set to <b>Auto Chn.</b> . Otherwise all cameras connected to one bus must have a <b>different</b> ISO channel.<br>⇒ <i>Auto Chn. is a SmartView feature, but not a camera feature.</i>  |
|  | Frame buffers<br> | By default SmartView reserves 16 <b>frame buffers</b> per camera in main memory. You can change that to a max. limit, which is dependent on your system and OS. After changing, SmartView displays how many buffers it currently uses (e.g. 2/786) so as not having to drop any frames coming from the camera.<br>The minimum of 3 ensures that normally no image from camera is to be discarded because of no available memory.<br>⇒ <i>Frame buffers is a SmartView feature, but not a camera feature, and is automatically saved in the registry (but not in the user sets) when closing SmartView.</i> |
|  | <input type="checkbox"/> Low noise binning   | Only Pike/Stingray:<br>Enables/disables low noise binning mode. This means: an average (and not a sum) of the luminance values is calculated within the FPGA.<br>The image is therefore darker than with the usual binning mode, but the signal to noise ratio is better (approximately a factor of $\sqrt{2}$ ).  |

Table 8: SmartView Edit settings: **Format** tab

| Section   | Check box/combo box/list/slider   | Description  |
|---|---|--|
| <a href="#">Format7 settings...</a><br>(max. abcd x efgh) | Left/Width/Top/Height<br>              | These are the <b>AOI settings</b> (only available in Format_7 modes)<br>For more information see Chapter <a href="#">Setting AOI (Format_7 settings)</a> on page 120.<br>Adjust <b>width</b> and <b>height</b> of camera image.<br>For images smaller than maximum image dimensions: adjust upper left corner via <b>left</b> and <b>top</b> position of camera image on image sensor. |
|   | Packet size<br>                        | To change packet size first deactivate <b>Auto size</b> check box.   |
|   | <input type="checkbox"/> Auto size<br> | Deactivate check box to adjust <b>packet size for isochronous packets</b> (via slider or combo box).<br><i>⇒ Auto size is a SmartView feature, but not a camera feature, and is automatically saved in the registry (but not in the user sets) when closing SmartView.</i>   |
|   | Max frame rate<br>                   | Shows the <b>maximum theoretical frame rate</b> . See Chapter <a href="#">Calculating frames per second</a> on page 123.   |
|   |   |  |

Table 8: SmartView Edit settings: **Format** tab

## Ctrl 1 tab descriptions

If available, you can do the following:

- Switch on/off the feature, by activating/deactivating the **On** check box.
- Switch on/off auto function, by activating/deactivating the **Auto** check box.
- Do one-push action, by clicking  button.
- Adjust the feature manually by moving the slider or changing the values directly (entering numbers or clicking up/down arrows.)

| Check box/combo box/list/slider Description  |   |
|--|---|
| Target grey level<br> | This is the <b>auto exposure</b> . Works in conjunction with auto shutter and auto gain.<br>Target grey level corresponds to <b>Auto_exposure</b> register 0xF0F00804 (IICC).<br>Increasing the <b>auto exposure</b> value (aka <b>target grey</b> value) increases the average brightness in the image and vice versa.   |
| Shutter<br>           | Adjust the electronic shutter <b>manually</b> . The set value is to be multiplied by the time base, which can be set here: Check box <a href="#">Timebase</a> on page 51  |
| Gain<br>              | Adjust the gain <b>manually</b> . Gain will change on the fly. The possible range depends on the camera model. The value is to be multiplied by a constant factor which is dependent on the camera model. A higher gain produces greater image noise. This reduces image quality. For this reason, try first to increase the brightness, using the aperture of the camera optics and/or longer shutter settings.  |
| Brightness<br>       | Adjusting the <b>brightness</b> manually changes the IICC register brightness at offset 800h. This effectively changes the offset in the image. The range is multiplied by a factor, dependent on the camera model.   |
| Gamma<br>           | Switch <b>Gamma</b> off/on<br>0 = Gamma off<br>1 = Gamma on<br>This is a non-linear stretching of the darker parts and compression of the brighter parts in the image to accommodate certain human and display non-linearities. The actual function used is described in the camera manual.<br>When using the LUT feature and the gamma feature pay attention to the following: <ul style="list-style-type: none"><li>• gamma ON → look-up table is switched ON also</li><li>• gamma OFF → look-up table is switched OFF also</li><li>• look-up table OFF → gamma is switched OFF also</li><li>• look-up table ON → gamma is switched OFF</li></ul> |

Table 9: SmartView Edit settings: **Ctrl 1** tab

| Check box/combo box/list/slider Description |  |
|---|--|
| White balance                               | <br>Only color cameras<br>Here you can do manual and automatic white balance. White balance is applied so that non-colored image parts are displayed non-colored. From the user's point, the white balance settings are made in register 80Ch of IIDC V1.3 or IIDC V1.31 (depending on camera model).<br>The values in the U/B_Value field produce changes from green to blue; the V/R_Value field from green to red. |
| Sharpness                                   | <br>Only available for Oscar, Marlin, Pike, Stingray<br>The color models are equipped with a two-step sharpness control, applying a discrete horizontal high pass in the green/Y channel.<br>See <b>Oscar/Marlin/Pike/Stingray Technical Manual</b> , Chapter <b>Sharpness</b> .  |

Table 9: SmartView Edit settings: **Ctrl 1** tab

## Ctrl 2 tab descriptions

If available (hue/saturation), you can do the following:

- Switch on/off the feature, by activating/deactivating the **On** check box.
- Switch on/off auto function, by activating/deactivating the **Auto** check box.
- Do one-push action, by clicking  button.
- Adjust the feature manually by moving the slider or changing the values directly (entering numbers or clicking up/down arrows.)

| Check box / combo box/ list / slider Description |   |
|--|---|
| Hue  | <br>Adjust <b>Hue</b> manually.<br>Hue performs a (slight) global shift of all colors in the image.                              |
| Saturation                                       | <br>Adjust <b>Saturation</b> manually.<br>Saturation changes the amount of the coloring from nominal down to zero or up to 200%. |

Table 10: SmartView Edit settings: **Ctrl 2** tab

| <b>Check box / combo box/ list / slider Description</b> |  |
|---|--|
| Auto-function AOI                                       | <p>This is a feature to limit the area in which parameters for the auto functions (auto gain, auto shutter, auto white balance) are calculated to a fraction of the image size. Can be used to exclude e.g. the sky from the gain/shutter regulations or perform auto white balance in only a specific subarea of the image.</p> <p>Switch on/off <b>auto-function AOI</b> by activating/deactivating <b>Enable</b> check box. Off uses the whole image size for autofunction parameters.</p> <p>Enter values: AOI width/height/left (coordinate) and top (coordinate). Allowed steps are shown in the fields X-Unit/Y-Unit.</p> <p>To highlight the AOI in the image, activate <b>Show AOI</b> check box.</p> |
| Auto shutter range                                      | <p>Choose standard (Std.) or extended (Extd.) <b>auto shutter range</b>. Change lower and upper limit to restrict the auto shutter to operate between these limits and <b>not</b> the whole range. Useful for applications where a too long shutter time would cause e.g. motion blurring in the image.</p>  |
| Auto gain range   | <p>Change <b>lower and upper limit</b>.</p> <p>Change lower and upper limit to restrict the auto gain to operate between these limits and <b>not</b> the whole range. Useful for applications where a too high gain would cause noise in the image.</p>  |

Table 10: SmartView Edit settings: **Ctrl 2** tab

## Ctrl3 tab descriptions (only color progressive)

Ctrl3 tab exists in two variants:

- Description for color progressive cameras see below
- Description for color interlaced see Chapter [Ctrl3 tab descriptions \(only color interlaced\)](#) on page 45

### Progressive cameras

| Check box / combo box/ list / slider Description  |  |
|---|--|
| Extra features during debayering  | <p>These two features (hue/saturation) are only available if camera transmitting RAW image and SmartView doing the debayering process, using one of the following algorithms:</p> <ul style="list-style-type: none"> <li>• 2x2 YUV422</li> <li>• 2x2 LCAA</li> <li>• 2x2 LCAA+V</li> </ul> <p>It effectively changes both hue and saturation during debayering on the PC.<br/>       See Chapter <a href="#">Additional adjustment of hue and saturation</a> on page 65.</p> <p>⇒ <i>These features are SmartView features, but not camera features.</i></p> |
| Hue<br>        | <p>Adjust <b>Hue</b> during debayering on the PC manually.<br/>       (values in degrees)</p> <p>⇒ <i>Hue on this tab is a SmartView feature, but not a camera feature.</i></p>  |
| Saturation<br> | <p>Adjust <b>Saturation</b> during debayering on the PC manually.<br/>       (values in percent)</p> <p>⇒ <i>Saturation on this tab is a SmartView feature, but not a camera feature.</i></p>  |

Table 11: SmartView Edit settings: Ctrl 3 tab (**progressive cameras**)

## Ctrl3 tab descriptions (only color interlaced)

Ctrl3 tab exists in two variants:

- Description for color progressive cameras see Chapter [Ctrl3 tab descriptions \(only color progressive\) on page 44](#)
- Description for color interlaced see below

### Interlaced cameras

| Check box / combo box/ list / slider Description |  |
|--|--|
| Advanced white balance                           | <p>For the interlaced color Guppies (Guppy F-038/038 NIR/044/044 NIR) using complementary color filters (Cy, Mg, Gr, Ye) there is a non-standard (non-IICC) register for white balance (0xF10080C4 and 0xF10080C8).</p> <p>This register is similar to the standard white balance CSR: here each of the four colors can be controlled independently. See the four sliders in this table.</p> <p> <b>Note:</b> One-push white balance is <b>not available</b>.</p> |
| Green/Cyan                                       | Adjust <b>advanced white balance</b> manually for <ul style="list-style-type: none"> <li>• <b>Green</b> in <b>Format_7 Mode_1</b> or</li> <li>• <b>Green/Cyan</b> in <b>Format_7 Mode_0</b></li> </ul>   |
| Magenta/Yellow                                   | Adjust <b>advanced white balance</b> manually for <ul style="list-style-type: none"> <li>• <b>Magenta</b> in <b>Format_7 Mode_1</b> or</li> <li>• <b>Magenta/Yellow</b> in <b>Format_7 Mode_0</b></li> </ul>   |
| Cyan/Magenta                                     | Adjust <b>advanced white balance</b> manually for <ul style="list-style-type: none"> <li>• <b>Cyan</b> in <b>Format_7 Mode_1</b> or</li> <li>• <b>Cyan/Magenta</b> in <b>Format_7 Mode_0</b></li> </ul>  |
| Yellow/Green                                     | Adjust <b>advanced white balance</b> manually for <ul style="list-style-type: none"> <li>• <b>Yellow</b> in <b>Format_7 Mode_1</b> or</li> <li>• <b>Yellow/Green</b> in <b>Format_7 Mode_0</b></li> </ul>  |

Table 12: SmartView Edit settings: **Ctrl 3 tab (interlaced cameras)**

## Trig/IO tab descriptions

| Section           | Check box / combo box/ list / slider Description  |
|-------------------|---|
| Trigger           | <p>Mode</p>  <p>The following trigger modes may be available (depending on camera model: internal/edge mode/level mode can be:<br/>Ext=external trigger<br/>SW=software trigger):</p> <ul style="list-style-type: none"> <li>• Internal (continuous output)</li> <li>• Edge mode(0)-Ext</li> <li>• Level mode(1)-Ext</li> <li>• Progr. mode(15)-Ext aka Trigger_Mode_15</li> <li>• Edge mode(0)-SW</li> <li>• Level mode(1)-SW</li> <li>• Progr. mode(15)-SW</li> </ul> <p>Beside <b>Internal</b> the other modes require a signal at the trigger pin of the I/O (HIROSE) connector to get an image.</p> |
|                   | <p>Polarity</p>  <p>Polarity of trigger signal (depending on camera model and mode)<br/>Edge mode(0) and Progr. mode(15):</p> <ul style="list-style-type: none"> <li>• Falling</li> <li>• Rising</li> </ul> <p>Level mode(1):</p> <ul style="list-style-type: none"> <li>• Low act.</li> <li>• High act.</li> </ul>  |
| Multishot counter |  <p>Choose number of images the camera will take.</p>  |
| Trigger delay     | <input type="checkbox"/> On <p>Delay between trigger signal and image acquisition<br/>On/off only available, when Edge mode(0)</p>  |
|                   |  <p>Delay time in <math>\mu</math>s for exposure start after trigger signal</p>  |

Table 13: SmartView Edit settings: **Trig/IO** tab

Table 13: SmartView Edit settings: **Trig/I0** tab

| Section           | Check box / combo box/ list / slider Description   |  |
|-------------------|--|--|
| Input/Output pins | List of all inputs and outputs of a camera.  | The number of inputs and outputs depend on the camera model.   |
|                   | <b>Mode</b> column   | For each pin you can choose one of the following modes:<br>Input $\Rightarrow$ (Off/Trigger)<br>Output $\Rightarrow$ (Off/Direct/IntegrationEnable/<br>FrameValid/Busy/FollowInp/<br>PulseWidthMod/ <b>WaitingForTrigger</b> ).<br>Query the camera manual for details on the signals. |
|                   | <b>Invert</b> column   | This is the <b>polarity bit</b> . The former <b>Polarity</b> column for the input/output pins is now called <b>Invert</b> to clarify the use of this bit. A polarity of <b>low</b> in former SmartView versions is now read as Invert:No, meaning the same.                            |
|                   | <b>State</b> column  | Lists the status of the input/output pin ( <b>Low</b> or <b>High</b> ).  |
|                   | <b>Period</b> column   | Only available for cameras with pulse width modulation (see Technical Manual).   |
|                   | <b>Width</b> column  | Only available for cameras with pulse width modulation (see Technical Manual).   |
|                   | <b>Debounce</b> column   | Enter debounce time in 500 ns increments.<br>Example:<br>3 is equivalent to $3 \times 500\text{ns} = 1.5\mu\text{s}$   |
|                   | <input type="checkbox"/> Poll the I/O state continually  | Activate check box to update the state of pins every 200 ms.   |
| Software trigger  | <br> | To start software trigger click <b>Trigger</b> button. It is self cleared, when using edge mode; must be set back manually (click <b>Stop trigger</b> button), when using level mode.  |

## LUT/Shdg. tab descriptions

### Note

- For a detailed description on **LUT** see Chapter [Working with LUTs](#) on page 84.
- For a detailed description on **shading** see Chapter [Working with shading](#) on page 77.

| Section       | Check box / combo box/ list / slider      | Description  |
|---------------|---|--|
| Lookup tables | <input type="checkbox"/> LUT operation on | Camera-internal LUT on/off   |
|               | LUT # <input type="button" value=""/>     | Choose camera-internal LUT (both: for uploading and selecting). There is one set for data per LUT number. Therefore LUT data combo box, Upload button and contents of LUT editor may change if you select a new LUT number.  |
|               | LUT data <input type="button" value=""/>  | Choose built-in LUT: <ul style="list-style-type: none"> <li>• data from the file below</li> <li>• a table for gamma = 0.7</li> <li>• a table for gamma = 0.45</li> <li>• a table for inversion</li> <li>• a table for identity</li> </ul> The following two entries are only for display: <ul style="list-style-type: none"> <li>• &lt;empty&gt; means: SmartView has not written any data into the camera yet. Therefore SmartView does not know what LUT data is currently used by the camera (LUT cannot be read from camera).</li> <li>• &lt;modified&gt; is displayed, whenever LUT data was modified by the LUT editor.</li> </ul> |
|               | <input type="button" value="Edit"/>       | Opens the LUT editor with built-in viewer and displays the uploaded LUT. For a detailed description see Chapter <a href="#">Using LUT editor with built-in viewer: Overview</a> on page 90   |

Table 14: SmartView Edit settings: **LUT/Shdg.** tab

| Section               | Check box / combo box/ list / slider  | Description  |
|-----------------------|---|--|
| Lookup tables (cont.) | <input type="button" value="Upload"/>   | Uploads the selected data into the camera. (Note: The button is colored to indicate that the LUT data in SmartView differs from the data in the camera.) |
|                       | LUT file <input type="button" value="..."/>   | Only available when choosing <b>data from the file below</b><br>Choose directory and file for upload process.  |
|                       | Import data from column <input type="button" value=""/> starting at <input type="button" value=""/> | Only available when choosing <b>data from the file below</b><br>Choose column where LUT is stored and choose row number where LUT starts.                |
| Shading correction    | <input type="checkbox"/> Shading correction on  | Shading correction on/off  |
|                       | <input type="checkbox"/> Show shading data as image   | Select shading image as camera output.   |
|                       | <input type="button" value="Build"/> shading data from <input type="button" value=""/>              | Builds camera-internal shading image. Choose number of images to be averaged (in order to reduce noise...) for building the shading image.               |
|                       | <input checked="" type="radio"/> Flash <input type="button" value="Save to flash"/>                 | Use option <b>Flash</b> to save/load shading image in user sets (inside camera).   |
|                       | <input type="button" value="Load from flash"/>  | Loads a shading image stored in user sets (inside camera).   |
|                       | <input type="button" value="Clear flash"/>  | Clears shading image stored in user sets (inside camera).  |
|                       | <input checked="" type="radio"/> File <input type="button" value="Download &amp; save as file"/>    | Use option <b>File</b> to save/load shading image to/from an external file.  |
|                       | <input type="button" value="Upload from file"/>   | Uploads an external stored shading image.  |
|                       | Shading data file <input type="button" value=""/> <input type="button" value="..."/>                | Choose different external files for uploading/saving. The combo box lists recently used shading files (for upload/save operations).                      |

Table 14: SmartView Edit settings: **LUT/Shdg.** tab

## Adv 1 tab descriptions

| Section               | Check box / combo box/ list / slider   | Description  |
|-----------------------|--|--|
| Extended shutter      |  μs           | <b>Absolute time of exposure</b> in μs. Settings override the standard shutter settings (and vice versa). Max. settings depend on camera model.  |
| Std. shutter timebase | Timebase      | AVT timebase controls the base factor for the standard shutter register. Camera needs to be stopped for changes in this register. Shutter value (Slider <b>Shutter</b> on page 41) is multiplied with time base. |
| Test images           | Active image  | Choose one of the camera-internal images as image source. Depending on the camera model you can choose between different test images.<br>See <b>AVT Technical Manuals</b> .                                      |
| Mirror image          | <input type="checkbox"/> Horizontal<br><input type="checkbox"/> Vertical                       | Depending on the camera model you can flip the image horizontally/vertically. This is done in hardware in the camera.  |

Table 15: SmartView Edit settings: **Adv 1** tab

| Section            | Check box / combo box/ list / slider  | Description   |
|--------------------|---|---|
| Deferred transport | <input type="checkbox"/> Hold images  | Deferred image transport is available for Stingray, Pike, Marlin, Oscar cameras. Activate <b>Hold images</b> to stop image transfer to the viewer (SmartView) and store the image in FIFO.  |
|                    | <input type="checkbox"/> Fast capture   | Activates <b>FastCapture</b> mode of AVT deferred image transport. The sensor is read out at its maximum speed. Alternatively the sensor is read out at a speed according to the transmission settings.   |
|                    | # of images to send <input type="button" value="▼"/>                                | Choose number of images which will be sent when clicking on <input type="button" value="Send images"/> . Set to 0 to send all images in FIFO.   |
|                    | FIFO size   | Displays size of internal image FIFO in terms of frames.  |
|                    | FIFO used   | Lists number of images currently held in FIFO.  |
|                    | <input type="button" value="Send images"/>  | Read(s) image(s) from FIFO and send images over bus to SmartView.   |
|                    | <input type="checkbox"/> Lock image capture   | Prevents AVT SmartView from sending ISO-enable/one-shot command to the camera when using the black arrows on bottom of window.<br><br>With <b>Lock image capture</b> activated the above buttons prepare SmartView viewer window without starting the camera (ISO enable).  |
|                    |  | With <b>Lock image capture</b> on, clicking on red arrows (free-run, one-shot) starts camera and images are captured into FIFO.<br> Capture images into the FIFO using free-run mode.<br> Capture images into the FIFO using one-shot mode. |
|                    | Version information   | Microcontroller/Order Number/<br>FPGA/Serial number   |

Table 15: SmartView Edit settings: **Adv 1** tab

## Adv 2 tab descriptions

| Section                  | Check box / combo box/ list / slider   | Description  |
|--------------------------|--|--|
| Serial port (I IDC-1.31) | Bitrate  | Choose <b>bit rate for camera's RS232 serial port</b> . It can be used to send and receive data to and from an external device, connected to the camera.                 |
|                          | Char length  | Choose <b>character length for serial input/output</b> : <ul style="list-style-type: none"> <li>• 7 bits</li> <li>• 8 bits</li> </ul>                                    |
|                          | Parity   | Choose <b>parity for serial input/output</b> <ul style="list-style-type: none"> <li>• none</li> <li>• odd</li> <li>• even</li> </ul>                                     |
|                          | Stop bits  | Choose <b>number of stop bits for serial input/output</b> <ul style="list-style-type: none"> <li>• 1 stop bit</li> <li>• 1.5 stop bits</li> <li>• 2 stop bits</li> </ul> |
|                          | <input checked="" type="radio"/> Serial port off<br><input type="radio"/> Transmitter on<br><input type="radio"/> Receiver on<br><input type="radio"/> Both on | Disable serial input/output of camera<br>Enable only serial sending<br>Enable only serial receiving<br>Enable bidirectional serial input/output                          |
|                          | Transmit <input type="text"/> <input type="button" value="Transmit"/>  | Enter text to be transmitted to camera.  |
|                          | Receive  | Any data which is received by the camera via RS232 will be displayed here until the buffer is full.  |

Figure 4: Example of CMOS tab for Guppy F-503

## Direct register access window

**Note** The height of this window can be adjusted, but not the width (although double arrows are shown).

**Definition** **Direct access** window is a tool to write data into registers directly and read out data from registers directly (in hex code).

| Check box / combo box / list |                                      | Description  |
|------------------------------|--------------------------------------|--|
| Register                     | <input type="button" value="▼"/>     | Lists all accessible registers by their clear names.   |
| Address                      | <input type="button" value="▼"/>     | The address of the chosen register is displayed immediately.<br>Alternatively you can enter an address in hex code manually. |
| Data                         | <input type="button"/>               | Lists the data that is read from or written to the chosen register.  |
| Read                         | <input type="button" value="Read"/>  | Reads data from chosen register.   |
| Write                        | <input type="button" value="Write"/> | Writes data in chosen register.  |
| List                         | # column                             | Counts the number of read/write actions.   |
|                              | <b>rw</b> column                     | Displays type of action:<br>rd=read<br>wr=write  |
|                              | <b>Address</b> column                | Displays the address of read/write action in hex code.   |
|                              | <b>Value</b> column                  | Displays the value of read/write action in hex code.   |

Table 20: Smart View **Direct access** window: descriptions

# Operating AVT cameras with SmartView

In this chapter you will find descriptions how to operate AVT cameras with the **SmartView** software. The most important camera functions are explained and you learn how to use these functions effectively with **SmartView**.

## Debayering algorithms

⇒ These algorithms are *SmartView* features, but not camera features.

### Conditions

- Only PC debayering (via SmartView)
- Only color cameras
- Works only in RAW8/RAW12/RAW16/Mono8 mode (depending on specific camera type); in RAW12/RAW16 mode only 2x2 algorithm available

### Where to find

SmartView:  Edit settings → Format tab

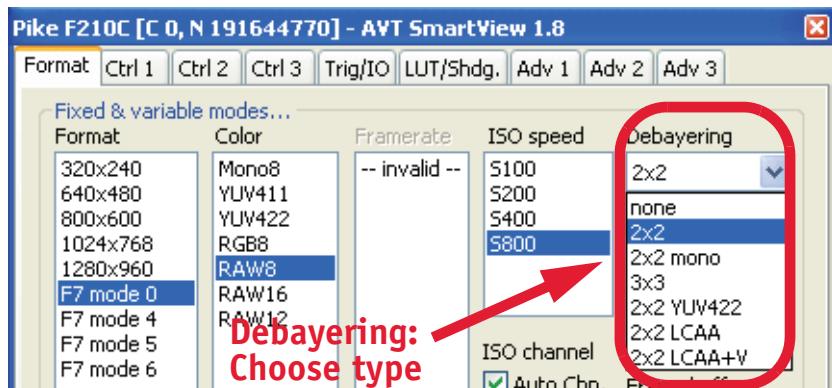

Figure 5: Debayering: Example of choosing type (Pike F-210C)

**Only RAW8 formats:** additional adjustment of hue and saturation possible (using methods YUV422/LCAA/LCAA+V):

SmartView:  Edit settings → Ctrl3 tab (color progressive)

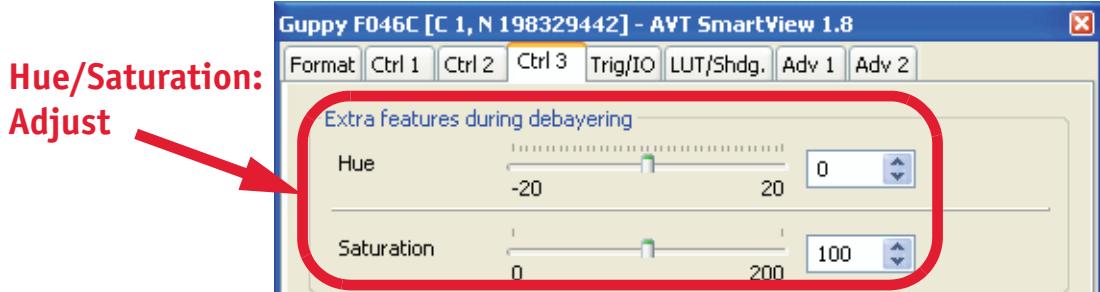

Figure 6: Hue and saturation: Example of additional adjustment (Guppy F-046C)

## Description

The following debayering algorithms are available (depending on specific camera type):

| Debayering algorithm | Choose type       | Description  | Advantages (+) and disadvantages (-)  |
|----------------------|-------------------|--|---|
| none                 | <b>none</b>       | No debayering  |   |
| 2x2                  | <b>2x2</b>        | debayering is done on a 2x2 pixel basis  | + fastest (lowest CPU consumption) algorithm<br>- color fringe                                    |
|                      | <b>2x2 mono</b>   | Showing only mono image (luminance Y only) of 2x2 debayering   | + no color fringe (b/w image)<br>- no color information   |
| 3x3                  | <b>3x3</b>        | Debayering is done on a 3x3 pixel basis  | + less color fringe<br>- less resolution<br>- more CPU consumption                                |
| 2x2                  | <b>2x2 YUV422</b> | Same algorithm as in AVT Marlin cameras (produces the same color output as Marlin in YUV422 mode). Color low-pass filtering with two horizontally neighboring pixels | + faster algorithm compared to LCAA and LCAA+V<br>- more horizontal color fringe than LCAA        |
|                      | <b>2x2 LCAA</b>   | LCAA = local color anti-aliasing<br>Color low-pass filtering with four horizontally neighboring pixels   | + less horizontal color fringe<br>- vertical color fringe   |
|                      | <b>2x2 LCAA+V</b> | LCAA+V = local color anti-aliasing including vertical color smoothing<br>Color low-pass filtering with a window of four horizontal and two vertical pixels           | + less horizontal and less vertical color fringe<br>- slowest algorithm (highest CPU consumption) |

Table 21: Description of debayering algorithms

The following BAYER patterns are available (depending on specific camera type):

| BAYER pattern | Description  |
|---------------|--|
| auto. pattern | Default  |
| RGGB          | Use one of these patterns, if e.g. older SmartView versions use the wrong BAYER pattern.       |
| GRBG          | The first two letters are of 1st row of sensor, the last two letters are of 2nd row of sensor. |
| GBRG          | R=red; G=green; B=blue   |
| BGGR          |  |

Table 22: Description of BAYER patterns

### **Additional adjustment of hue and saturation**

- The following three types (YUV422, LCAA, LCAA+V) convert the transported RAW8 image to the YUV space.
- Here the (different) low-pass filtering of the color information (U and V values) is done to reduce color fringe at edges.
- Hue and saturation require intensive computations in YUV. If hue is 0 (no hue rotation) and saturation 100 (=100%) a more efficient back transformation is done.
- After that conversion to BGR space (Windows RGB) is done.

## Advanced white balance (only Guppy color interlaced)

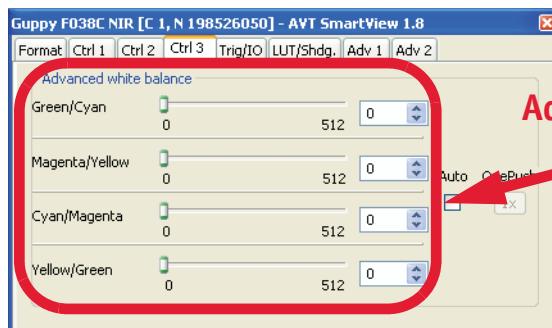

### Conditions

- Only Guppy color interlaced cameras
- Only Format\_7 Mode\_0 and Mode\_1

### Where to find

**Only Guppy (interlaced):** adjustment of advanced white balance possible:

SmartView: Main window:  Edit settings → Ctrl3 tab

Advanced white balance:  
Adjust  
Green, Magenta,  
Cyan, Yellow

Figure 7: Advanced white balance: Example of adjustment G, Mg, Cy, Ye (Guppy F-038C NIR)

### Description

Guppy interlaced cameras use color sensors with complementary color filters (Green, Magenta, Cyan and Yellow). This sensor type is **not** covered by IIDC specification.

White balance requires a set of advanced registers to allow adjustments. In addition, there are two different Format\_7 modes available:

- Mode\_0 which effectively bins two rows and
- Mode\_1 which is a frame integration mode

Thus Mode\_0 and Mode\_1 perform differently from the point of white balancing.

- Format\_7 Mode\_0** In Format\_7 Mode\_0 (**field integration**, two lines are binned during sensor readout) advanced white balance is adjustable for each of the individual (binned-) pairs:
- Green/Cyan
  - Magenta/Yellow
  - Cyan/Magenta
  - Yellow/Green

**Format\_7 Mode\_1** In Format\_7 Mode\_1 (**frame integration**, two lines are binned in the software) advanced white balance is adjustable for each of the individual complementary colors:

- Green
- Magenta
- Cyan
- Yellow

There is **no** one-push function. Set the camera to auto to perform continuously white balance or switch auto off after the correct white balance is achieved.

# Saving and streaming images

## Conditions

- Hard disk or network drive with enough space
- Recording: Make one or more images. Then the recording options are available.
- Use deep images: only available with camera models having MON012/16 (monochrome models) or RAW12/16 (color models)

## Where to find

SmartView: Main window: File →  Save

SmartView: Main window: File → Save as...

SmartView: Main window: File → Recording options

SmartView: Main window: File →  Use deep images

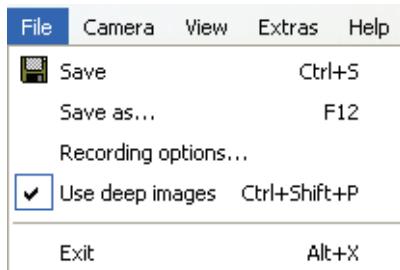

Figure 8: Where to find: Saving and streaming images

## Description

### Saving images to hard disk or network drive

To save a single image to hard disk or network drive, use the **File → Save as...** command, choose directory and file name on your hard disk or network drive and choose the file format. The following file formats are available:

- BMP (\*.BMP, \*.DIB, \*.RLE)
- JPEG (\*.JPG, \*.JPEG, \*.JPE, \*.JFIF)
- GIF (\*.GIF)
- TIFF (\*.TIF, \*.TIFF)
- PNG (\*.PNG)

When saving *16-bit images* with **Save as...** command the ending **\*.raw** is set automatically (although you can choose bmp, jpeg, gif, tiff, png only in the dialog) to the file name. The reason is the following: Windows operating sys-

tem is unable to display more than 8 bit. For display in SmartView the images are reduced to the upper 8 bit. Other image processing tools must be able to handle images with more than 8 bit.

For more information on deep images see Chapter [Using deep images \(only MON012/16 mode or RAW12/16 color mode\)](#) on page 71.

| File format | Compressed/lossless    | Description  |
|-------------|------------------------|--|
| BMP         | Uncompressed, lossless | Best file format for all your applications. All image processing tools can open BMP files.   |
| JPEG        | Compressed, lossy      | JPEG is a lossy format and file size is much smaller than bmp. Be aware that you may lose details in the image.                                  |
| GIF         | Uncompressed, lossless | Use GIF only if it is acceptable to store image only with 256 colors.  |
| TIFF        | Uncompressed, lossless | Tagged image file format, used in the printing industry. Use TIFF only if required; e.g. your image processing tool works only with TIFF format. |
| PNG         | Compressed, lossless   | PNG has compression and works lossless.  |

Table 23: Description of file formats

When the file exists, you can choose **File →  Save** or just click on the  button to overwrite the file.

## Streaming images: recording options

### Note

**Precondition:** First make one or more images, otherwise the **Recording options** menu is not available.

**Streaming** is **not** meant in the sense of a video file. You will have to use third party software to do offline conversion from the streamed images to a video file.

Alternatively **Streampix** software from [www.norpix.com](http://www.norpix.com) can be recommended for directly recording to a video file.

To continuously save images to hard disk or network drive in a streaming format, use the **File → Recording options** and configure your recording in the **Recording options** window (see [Table 24: Recording options window: Descriptions](#) on page 71).

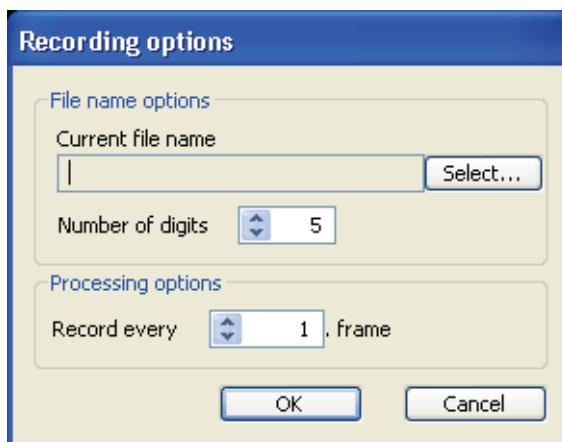

Figure 9: **Recording options** window

### Note

Be aware that it is **not** guaranteed that each and every image from the camera is finally recorded to disk. SmartView is not optimized for unlimited recording.

You may improve the performance by setting the Frame buffers in **Format** tab of SmartView (see [Frame buffers](#) on page 39) to the maximum your system (and main memory) allows. Usually this amount of images can be recorded without loss of frames.

| Section            | Check box / combo box/ list / slider Description   |  |
|--------------------|--|--|
| File name options  | Current file name<br>    |  |
|                    | Number of digits  5<br>First choose number of digits for file name of all images in streaming format.<br>Default: 5<br>Example:<br>recording_test00000.bmp<br>recording_test00001.bmp<br>...<br>recording_test99999.bmp |  |
| Processing options | Record every  1 . frame   | Choose if you want to record: <ul style="list-style-type: none"><li>• every frame (1)</li><li>• every second (2)</li><li>• every third (3)</li><li>• ...</li><li>• every nth (n)</li></ul> |

Table 24: **Recording options** window: Descriptions

To start recording click on .

### **Using deep images (only MONO12/16 mode or RAW12/16 color mode)**

**Definition** Deep images mean: in SmartView, 16 bits are used for storing and processing the image, if the depth of the sent images is larger than 8 bits.

All AVT models except for color Marlin models are capable of sending either MONO16 or RAW16 images. Only certain Pike/Stingray/ Guppy / Guppy PRO models are also able to transport images in AVT specific **Packed 12-Bit Modes** called MONO12 and RAW12.

Depending on the camera the significant bits will be between 8 and 16 bits. The bit depth is MSB-aligned, that means a 10-bit image in the 16-bit format appears to have the same brightness as a 12-bit image, but the 12-bit image contains 2 more LSBs important for the finer grey-level details in an image.

Availability depending on camera model:

| Camera model   | Deep images available? | Advantages (+) and disadvantages (-)   |
|--|------------------------|--|
| All camera models which have the following formats:<br>MONO12/RAW12 or MONO16/RAW16 support deep images. |                        | Deep images have the following advantages (+) and disadvantages (-)<br>+ images with enhanced dynamic<br>- Windows operating system is unable to display more than 8 bit. For display in SmartView the images are reduced to the upper 8 bit. Other image processing tools must be able to handle images with more than 8 bit. |

Table 25: Which cameras can use deep images?

For cameras with available deep images (MONO12, MONO16, RAW12 or RAW16) click on

**File →  Use deep images** to use images with more than 8 bits.

Activating/deactivating deep images is stored automatically when closing the window.

Enhancements during deep image support are:

- Extended histogram: activating/deactivating deep images changes display of histogram instantaneously
- Tooltip pixel values are adjusted.
- Saving 16-bit images is possible: with **Save as...** command the ending \*.raw is set automatically (although you can choose bmp, jpeg, gif, tiff, png only in the dialog) to the file name.
- Recording with 16-bit images is also possible.

**Note**

Saving images in deep image format, the file format is RAW, which means without header or trailer, as coming from the camera.

The higher byte comes first (the so called **big endian format**) and the assembled pixel value is **MSB-aligned**. That means: Unused lower bits are zero.

Example: a sequence of two 16-bit pixel „7F F0 FE 50“ of a 12-bit image refers to „07FF 0FE5“ (equals „2047 4069“ in decimal) values of the ADC.

**Caution**

Working with **deep images**, more processor power is needed:  
**The viewer may be slower leading to dropped frames.**

## Loading and saving camera settings as XML files

### Conditions

- To save and load camera settings to and from an XML (eXtensible Markup Language) configuration file, the MSXML parser must be installed on your system.
- Msxml3ger.msi: Installation file for the MSXML parser, version 3 service pack 4, German. For information or other languages see <http://www.microsoft.com/downloads>
- For quick read/write settings you first must create/save an xml file as standard xml file (**Select Settings file...** see below)

### Where to find

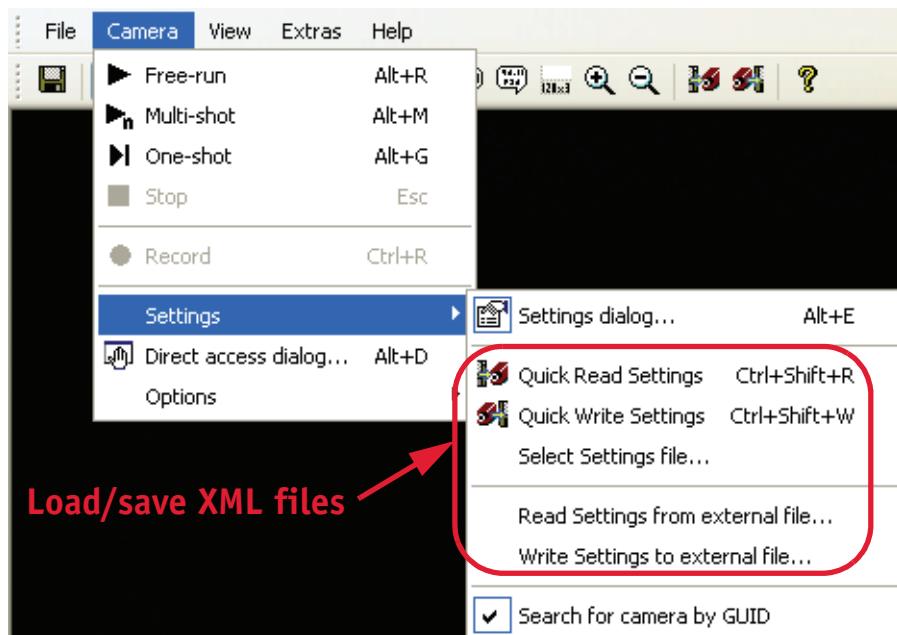

Figure 10: Where to find: Loading and saving camera settings as XML files

**Camera → Settings → Read settings from external file...**

**Camera → Settings → Write settings to external file...**

**Camera → Settings → Select Settings file...**

**Camera → Settings →  Quick Read Settings**

**Camera → Settings →  Quick Write Settings**

## **Description**

Most of the configurations of cameras and features in SmartView can be saved on your computer in an XML file. Save your most used configurations in different XML files. This gives you the advantage to choose quickly between different settings.

For very quick loading/saving of one special setting you can use the **Select Settings file...** command and then the

- **Quick Read Settings**  button or
- **Quick Write Settings**  button

As an alternative save your camera settings as user settings in the camera.

## Working with the histogram function (SmartView feature only)

⇒ The histogram function is a SmartView feature,  
but not a camera feature.

### Conditions

- Minimum size of histogram window is 256x128.
- Using deep images, histogram will show values up to 16 bit.

### Where to find

View → Additional information →  Histogram

(or use short key: **Ctrl+Shift+H**)

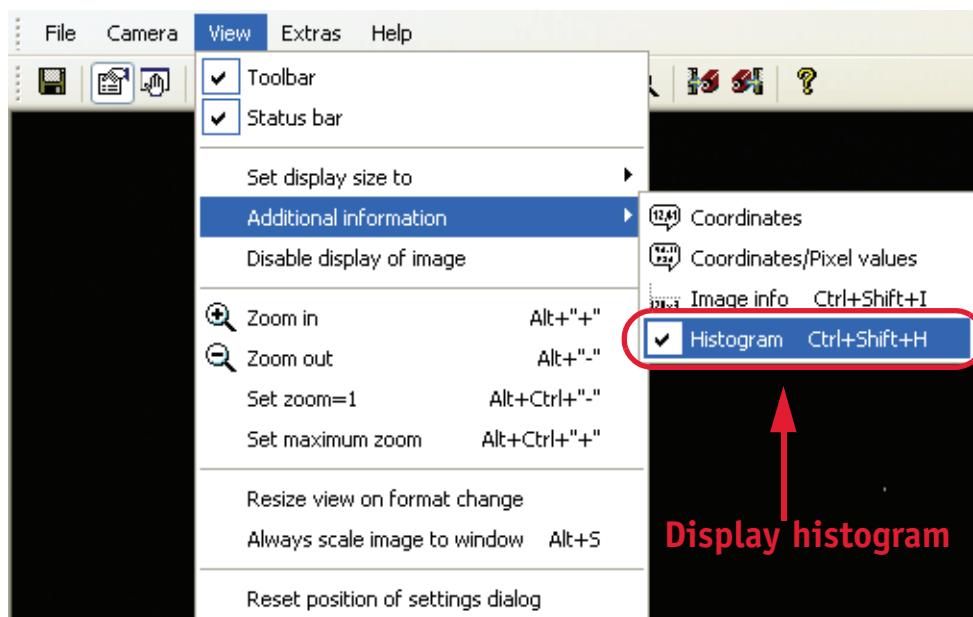

Figure 11: Where to find: Histogram

### Description

A histogram shows the brightness distribution of an image (e.g. in an 8-bit image there will be 256 levels of brightness ranging from 0...255 with 0 as darkest and 255 as brightest value). The sum under the curve is equal to the total amount of pixels. Use the histogram for analyzing and optimizing brightness distributions.

- **Monochrome** cameras show one red curve in the histogram

- **Color** cameras show three curves (red, green, blue) in the histogram
- **Interlaced** cameras show four curves (red, green, blue, yellow) in RAW mode and three curves with debayering (red, green, blue)

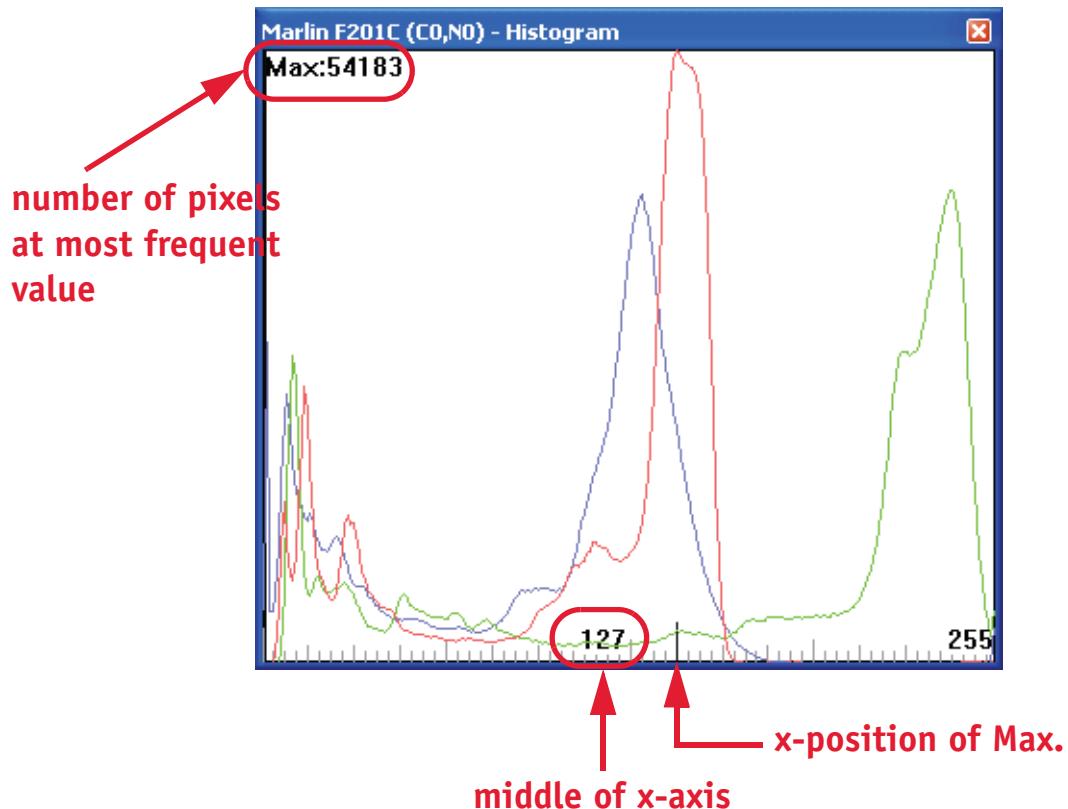

Figure 12: Example of histogram (Marlin F-201C)

| Histogram element | Description   |
|-------------------|---|
| x axis            | Available values:<br>8-bit image: 0...255<br>12-bit image: 0...4095 (Oscar)<br>14-bit image: 0...16383 (e.g. Pike Mono16)<br>16-bit image: 0...65535 (e.g. Oscar with 16 images or Pike with 4 images; both in HSNR mode) |
| y axis            | Number of pixels with value at x axis   |
| Max:              | Number of pixels at most frequent value (the corresponding x value is marked with an additional vertical black line: x-position of Max.)  |

Table 26: Description of histogram

| Histogram element | Description      |
|-------------------|------------------|
| 127 (8-bit)       | Middle of x-axis |
| 255 (8-bit)       | Maximum x value  |

Table 26: Description of histogram

### Using histogram

The following 3 examples illustrate how to use the histogram function:

1. Experiment how the histogram changes on **opening/closing aperture**:
  - Open aperture: curve(s) move to right side
  - Closing aperture: curve(s) move to left side
2. **Manual white balance** (e.g. single-color/monochrome surface):
  - Consider green curve as reference
  - Adjust UB slider of white balance so that blue curve overlaps green curve
  - Adjust VR slider of white balance so that red curve overlaps green curve
  - Manual white balance done
3. To get a feeling for **contrast of image**:
  - If an image has little contrast, histogram will show Gaussian like curve(s) very likely.
  - If an image has very high contrast, histogram will show much more irregular curve(s).

## Working with shading

**Definition** **Shading correction** is also known as **flat-field correction**. It is effectively a multiplicative correction of each pixel. The cameras perform this task in hardware, thus not consuming any CPU power or delaying the image. In order to generate the correction factors per pixel, only an offline task in the camera does all the job.

Upon generation of the shading image in the camera, it can be uploaded to the host computer for non-volatile storage purposes.

With the Pike, you are now able to store your generated shading data in flash memory inside the camera, allowing you to calibrate your imaging setup once under controlled conditions and then just load the stored shading data with one command after camera startup without having to transfer data from the PC to the camera.

For this, you are now able to switch the external source/destination from “file” (like it was possible before) to “flash”, allowing you to store to flash, load from flash and to clear the flash instead of downloading and saving shading data to a file or uploading from a file.

## Additional information

For additional information on the **shading correction** feature read the following chapters:

- **Oscar Technical Manual**, Chapter **Shading correction**
- **Marlin Technical Manual**, Chapter **Shading correction**
- **Pike Technical Manual**, Chapter **Shading correction**
- **Stingray Technical Manual**, Chapter **Shading correction**

## Conditions

- Oscar cameras
- Marlin cameras
- Pike cameras
- Stingray cameras
- (Guppy cameras have no shading correction)
- (Guppy PRO cameras have no shading correction)

## Where to find

SmartView:  Edit settings → LUT/Shdg. tab

Configure  
shading correction

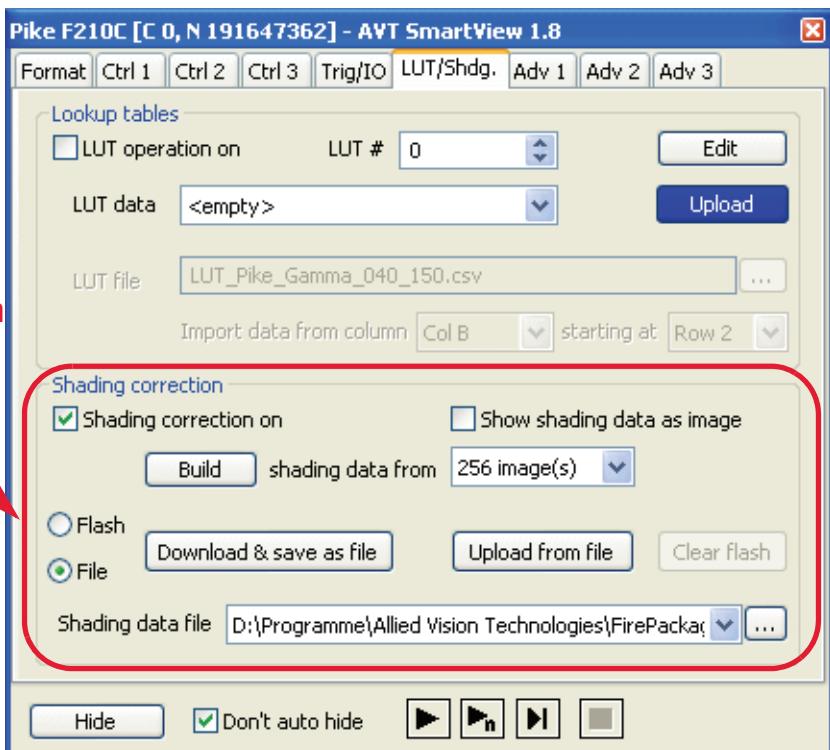

Figure 13: Shading correction: Example (Pike F-210C)

## Description

**Usage** Shading correction is used to compensate for non-homogeneities caused by lighting or optical characteristics within specified ranges.

To correct a frame, a multiplier from 1...2 is calculated for each pixel in 1/256 steps: this allows for shading to be compensated by up to 50%.

Besides generating shading data off-line and downloading it to the camera, the camera allows correction data to be generated automatically in the camera itself.

**Note** For conditions and special features depending on the camera family/model see the **Technical Manuals** listed in Chapter [Additional information](#) on page 78.

There are two storing possibilities:

- After generating the shading image in the camera, it can be uploaded to the host computer for nonvolatile storage purposes.
- The shading image can be stored in the camera itself. (Pike only)

The following pictures describe the process of automatic generation of correction data (Pike F-032C). Surface plots and histograms were created using the **ImageJ** program.

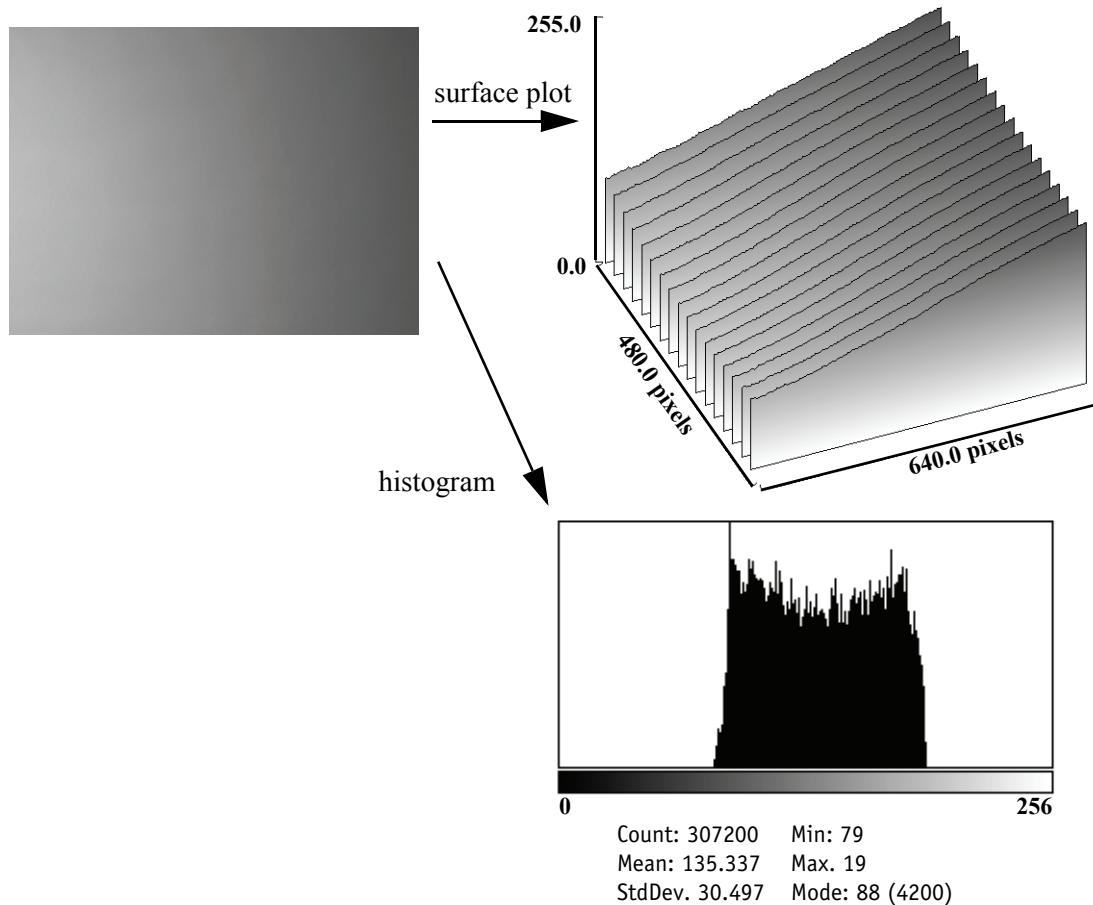

Figure 14: Shading correction: Source image with non-uniform illumination

- On the left you see the source image with non-uniform illumination.
- The surface plot on the right clearly shows a gradient of the brightness (0: brightest → 255: darkest pixels).
- The histogram shows a wide band of gray values.

By defocusing the lens, high-frequency image data is removed from the source image, therefore its not included in the shading image.

### How to prepare for shading image

Shading correction compensates for non-homogeneities by giving all pixels the same gray value as the brightest pixel. This means that only the background must be visible and the brightest pixel has a gray value of less than 255 when automatic generation of shading data is started.

It may be necessary to use a neutral white reference, e.g. a piece of paper, instead of the real image.

To generate a correction image do the following:

1. In SmartView main window click  **Edit settings** → **LUT/Shdg.** tab
2. In the **Shading correction** section activate  **Shading correction on** check box.
3. Activate  **Show shading data as image** check box.
4. Choose the number of images  to use for building the shading image (shading data). The recommended number of images for shading correction is listed in the table below.

| <b>Camera type</b> | <b>Recommended number of images for shading correction</b> |
|--------------------|--|
| Oscar              | 4, 8, 16   |
| Marlin             | 4, 8, 16   |
| Pike               | 2, 4, 8, 16, 32, 64, 128, 256                              |

Table 27: Recommended number of images for shading data

5. Click on  .

The automatic generation of shading data is started. The camera pulls in the number of images which were set in the combo box. An arithmetic mean value is calculated from them (to reduce noise).

After this, a search is made for the brightest pixel in the mean value frame. The brightest pixel(s) remain unchanged. A factor is then calculated for each pixel to be multiplied by, giving it the gray value of the brightest pixel.

All of these multipliers are saved in a **shading reference image**. The time required for this process depends on the number of frames to be calculated and on the resolution of the image.

#### Note

For conditions and special features depending on the camera family/model see the **Technical Manuals** listed in Chapter [Additional information](#) on page 78.

### How to load a shading image out of the camera

**Two saving mechanisms** are possible:

- Saving shading reference image **to flash** (currently only Pike family)
- Saving shading reference image **to file** (all camera models with shading correction)
- Shading images can also be generated or modified with image processing software. You can use this mechanism to overlay symbols or generate a cross hair in the image by simply generating a „synthetic shading image“ with the symbol or the cross hair.

| For saving to flash ...   | For saving to file ...  |
|---|---|
| <ul style="list-style-type: none"> <li>Choose <input checked="" type="radio"/> Flash.</li> <li>Click <input type="button" value="Save to flash"/>.</li> </ul> | <ul style="list-style-type: none"> <li>Choose <input checked="" type="radio"/> File.</li> <li>Click <input type="button" value="Download &amp; save as file"/>.</li> <li>Click <input type="button" value="..."/>, choose directory and enter file name.</li> </ul> |
| The shading reference file is saved...  |   |
| internal into flash memory  | in an external file   |

Table 28: Saving shading reference image to flash or data file

## 6. Focus the lens again.

The image below will be seen, but now with a considerably more uniform gradient.

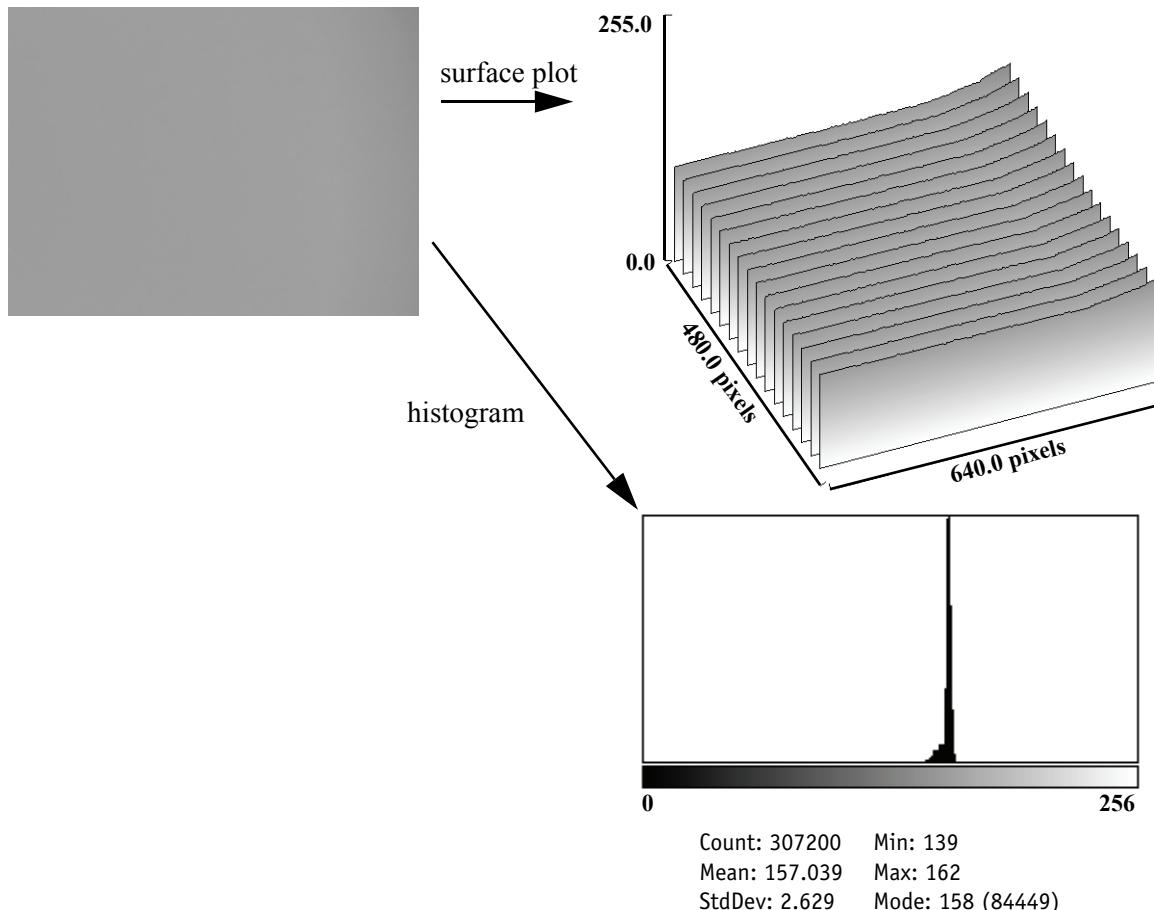

Figure 15: Example of shaded image

- On the left you see the image after shading correction.

- The surface plot on the right clearly shows nearly no more gradient of the brightness (0: brightest → 255: darkest pixels). The remaining gradient is related to the fact that the source image is lower than 50% on the right hand side.
- The histogram shows a peak with very few different gray values.

### How to load a shading image into the camera

To load a generated correction image back into the camera do the following:

1. In SmartView main window click  **Edit settings** → **LUT/Shdg. tab**.

| For loading from flash ... (inside camera)  | For loading from file ... (outside camera)   |
|---|--|
| In the <b>Shading correction</b> section choose ...   |  |
| <ul style="list-style-type: none"> <li>• Choose  Flash.</li> <li>• Click .</li> </ul> | <ul style="list-style-type: none"> <li>• Choose  File.</li> <li>• Click .</li> <li>• Click , choose directory and enter file name.</li> </ul> |
| The shading reference file is uploaded...   |  |
| from flash memory inside camera   | from external file outside camera  |

Table 29: Saving shading reference image to flash or data file

## Working with LUTs

**Definition** In image processing, look-up tables are often called LUTs, and they map index numbers to output values.

### Conditions

- All AVT cameras have LUT feature.

### Where to find

SmartView: Main window:  Edit settings → LUT/Shdg. tab

Configure  
look-up tables  
(LUT)

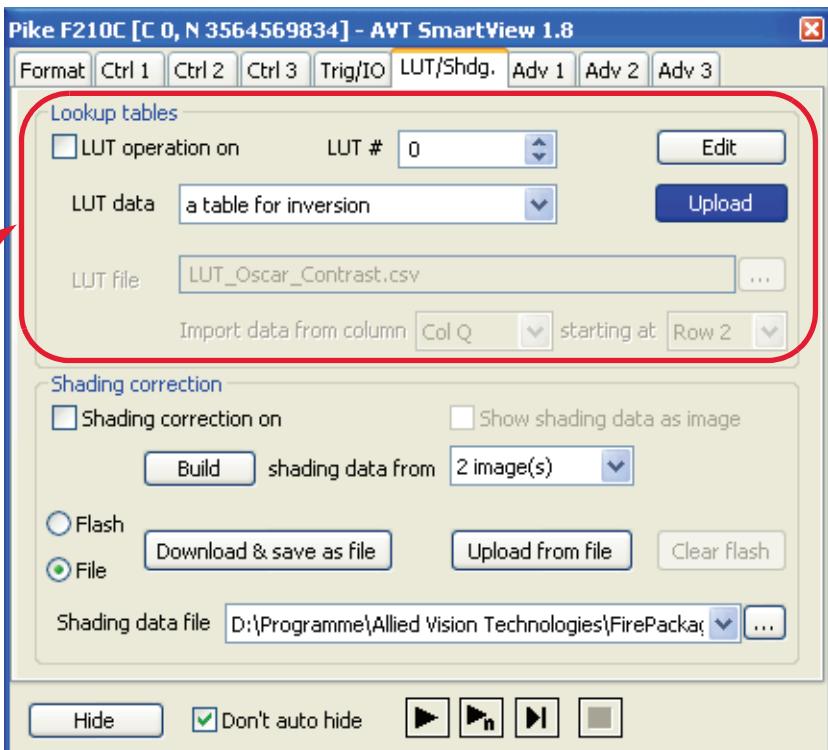

Figure 16: Look-up tables (LUT): Example (Pike F-210C)

## Description

**How many?** Depending on the model AVT cameras provide from 1 up to 63 user-defined look-up tables (LUT).

| Camera type | ... has how many LUTs? | Description  |
|-------------|------------------------|--|
| Stingray    | 1                      | The LUT # starts always with 0.                                |
| Pike        | 16 (# 0-15)            |  |
| Guppy PRO   | 1                      | Camera types having only one LUT: the LUT # cannot be changed. |
| Guppy       | 1                      |  |
| Marlin      | 1                      |  |
| Oscar       | 1                      |  |

Table 30: Number of LUTs depending on camera type

**Usage** The use of one LUT allows any function (in the form Output = F(Input)) to be stored in the camera's RAM and to be applied on the individual pixels of an image at run-time.

The address lines of the RAM are connected to the incoming digital data, these in turn point to the values of functions which are calculated offline, e.g. with a spreadsheet program.

This function needs to be loaded into the camera's RAM before use.

**Example** One example of using an LUT is the gamma LUT: see Chapter [Using SmartView's built-in LUTs](#) on page 87.

**Gamma LUT** The gamma LUT is known as compensation for the nonlinear brightness response of many displays e.g. CRT monitors. The look-up table converts the incoming bits from the digitizer to outgoing bits (for values see following table).

| Camera type | incoming ... bits | outgoing ... bits   |
|-------------|-------------------|---|
| Stingray    | 14                | the most significant 12 bit of the 14 bit are used and further down converted to 10 bit |
| Pike        | 14                | up to 14  |
| Guppy PRO   | 14                | the most significant 12 bit of the 14 bit are used and further down converted to 10 bit |
| Guppy       | 10                | 8   |

Table 31: Gamma LUT: incoming/outgoing bits

| Camera type | incoming ... bits | outgoing ... bits |
|-------------|-------------------|-------------------|
| Marlin      | 10                | 8                 |
| Oscar       | 12                | 8                 |

Table 31: Gamma LUT: incoming/outgoing bits

### Using AVT's spreadsheet LUTs (camera family dependent)

For each camera family AVT delivers specialized spreadsheets with a variety of LUTs which you can use immediately.

To use AVT's spreadsheet LUTs do the following:

1. Choose **data from the file below** in the LUT data combo box, click  and choose directory and LUT file you like to use. (Example: **LUT\_Pike\_Gamma\_040\_150.csv**. Description: see table below. Or use your own \*.csv file.).
  - All functions in the delivered AVT **...Gamma\_040\_150.csv** file start in row 2 (first row = header row). The first look-up table with gamma=0.4 is **Col B**. The steps between two columns is 0.05. So gamma=0.9 for example is **Col L**.
  - All functions in the delivered AVT **...Contrast.csv** file start in row 2 (first row = header row). The first contrast table with 0.25 is **Col B** and the last contrast table with 4 is **Col Q**.

#### Caution

If using the LUT editor (Chapter [Using LUT editor with built-in viewer: Overview](#) on page 90) only the chosen column is displayed and on saving the modified LUT you loose all other columns.

Therefore: If you want to work with the delivered AVT **...Gamma\_040\_150.csv** file and the delivered AVT **...Contrast.csv** file:

**Never use the Save button in the LUT editor, unless using a new file name.**

2. From the two combo boxes  choose column (example: **Col B**) and row (example: **Row 2**) for the function to be applied.
3. Click  . (Note: The button is colored to indicate that the LUT data in SmartView differs from the data in the camera.)  
 The chosen LUT is uploaded to the camera. The button changes to  , to indicate that the LUT data in SmartView is the same as in the camera.
4. To get a feeling how the LUT looks like click  .  
 The LUT editor opens and a graph of the chosen LUT is displayed.

**Note**

Because AVT camera families have different bit depths there is a need for different LUT files (see the following table).

As examples AVT delivers spreadsheet LUTs for each camera family:

- Gamma tables
- Contrast tables

| Camera type | ... is delivered with LUT files                               | Description   |
|-------------|---|---|
| Stingray    | LUT_Stingray_Gamma_040_150.csv<br>LUT_Stingray_Contrast.csv   | <b>...Gamma_40_150.csv</b><br>provides gamma tables (gamma functions with gamma 0.4 up to 1.5, using steps of 0.05)   |
| Pike        | LUT_Pike_Gamma_040_150.csv<br>LUT_Pike_Contrast.csv           | <b>...Contrast.csv</b><br>provides LUTs for increasing or decreasing the contrast for an image. Each of them has 16 tables with contrast values ranging from factor 0.25 to factor 4. A factor of 4 means that the gradient in the middle of the LUT is steeper by a factor of 4. |
| Guppy PRO   | LUT_Guppy_PRO_Gamma_040_150.csv<br>LUT_Guppy_PRO_Contrast.csv |   |
| Guppy       | LUT_Guppy_Gamma_040_150.csv<br>LUT_Guppy_Contrast.csv         |   |
| Marlin      | LUT_Marlin_Gamma_040_150.csv<br>LUT_Marlin_Contrast.csv       |   |
| Oscar       | LUT_Oscar_Gamma_040_150.csv<br>LUT_Oscar_Contrast.csv         |   |

Table 32: Description of LUTs depending on camera type

### Using SmartView's built-in LUTs

SmartView has the following LUTs for using without any (external) \*.csv files:  
See [Table 33: Description of LUTs available in SmartView](#) on page 88.

To use them do the following:

1. Choose any of the built-in LUTs (**a table for...**) in the LUT data combo box and choose a LUT # where this LUT will be written to.
2. Click **Upload**.

The chosen LUT is uploaded to the camera. The button changes to **Upload**, to indicate that the LUT data in SmartView is the same as in the camera.

3. To get a feeling how the LUT looks like click **Edit**.

The **LUT editor** opens and a graph of the chosen LUT is displayed.

In the following table you find example graphs (Pike F-210C) for SmartView's built-in LUTs.

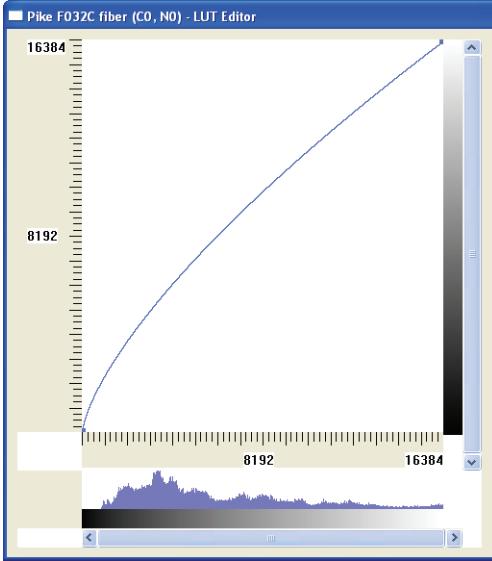

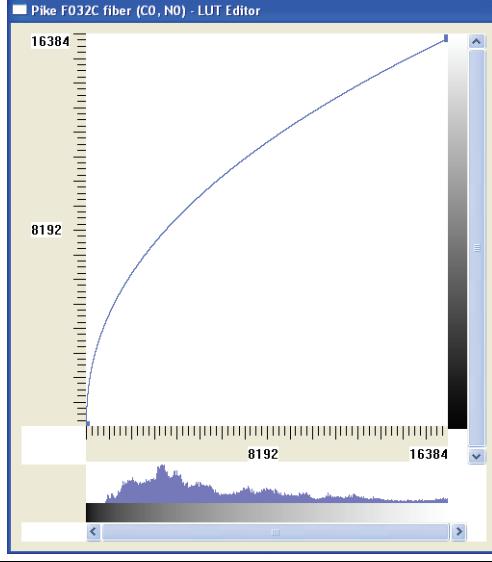

| Name of LUT (SmartView)         | Description   | Display LUT  |
|---------------------------------|---|--|
| <b>a table for gamma = 0.7</b>  | Table with the following function:<br>$\text{Output}=(\text{Input})^{0.7}$  |    |
| <b>a table for gamma = 0.45</b> | Table with the following function:<br>$\text{Output}=(\text{Input})^{0.45}$ |  |

Table 33: Description of LUTs available in SmartView

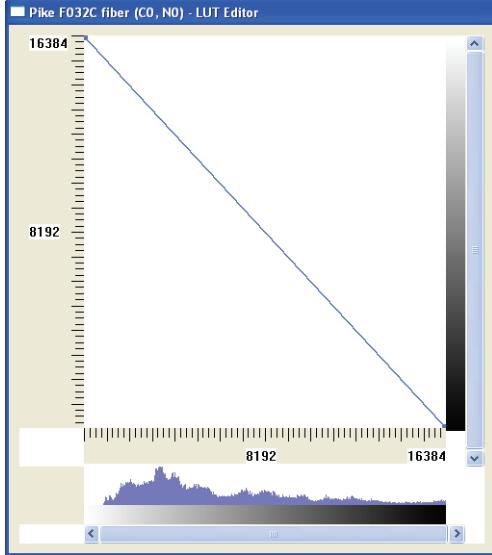

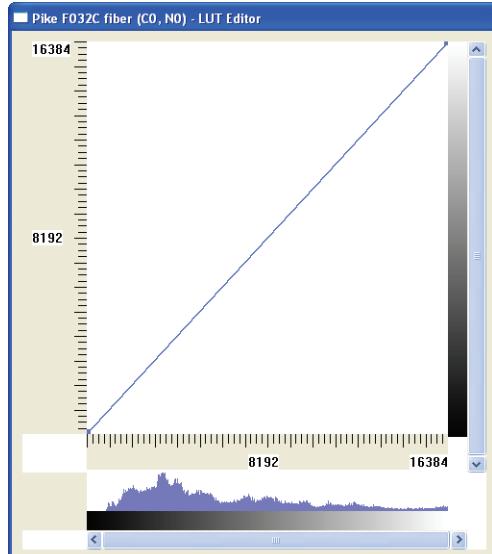

| Name of LUT (SmartView)      | Description  | Display LUT  |
|------------------------------|--|--|
| <b>a table for inversion</b> | Table with the following function:<br><br>The identity graph is mirrored at the middle axis. |    |
| <b>a table for identity</b>  | Table with the following function:<br><br>Output=Input                                       |  |

Table 33: Description of LUTs available in SmartView

## **Using LUT editor with built-in viewer: Overview**

### **Where to find**

Main window:  Edit settings → LUT/Shdg. tab → 

### **Note**

- Requirements for display of histogram and **Preview** button:
  - 12-bit or 16-bit mode (Raw or Mono)
  - one acquired image in one of this modes
  - stop image acquisition before opening the LUT editor
- By closing the LUT editor, the original image is restored.

The following screenshot shows the main elements of the LUT editor:

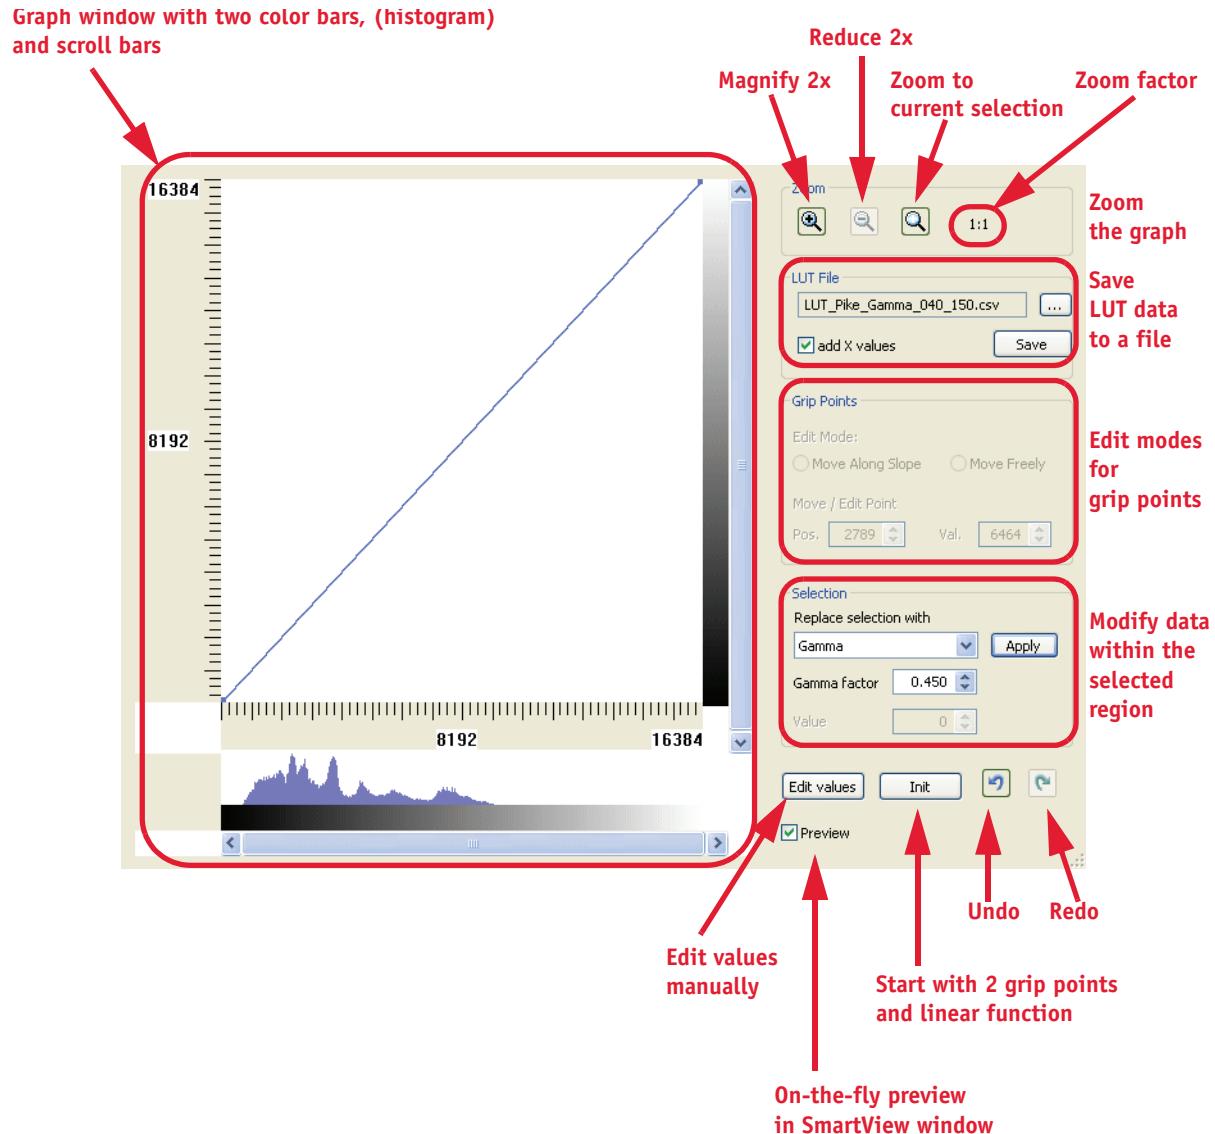

Figure 17: LUT editor with built-in viewer

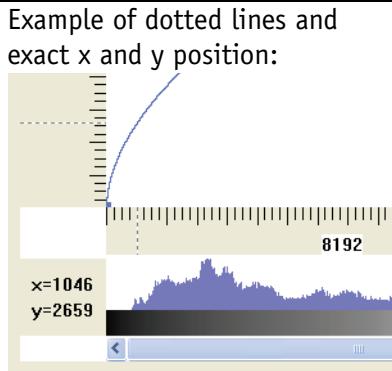

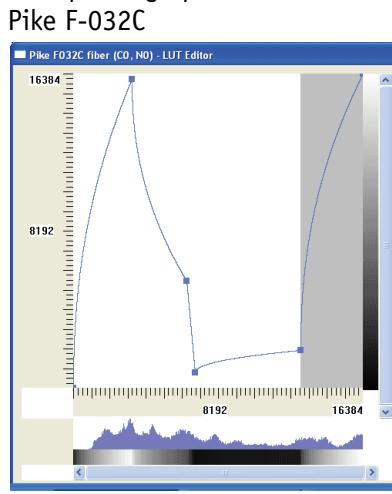

| Window element   | Description   | Examples, controls, buttons   |
|--|---|---|
| Graph window   | <ul style="list-style-type: none"> <li>shows LUT data as graph</li> <li>With mouse cursor inside graph window, dotted lines in X and Y axis show position of associated LUT data value. Exact values are displayed in the lower left corner of graph window.</li> </ul> <p>X=....<br/>y=....</p>                            | <p>Example of dotted lines and exact x and y position:</p>  |
| Color bar<br>(below graph: horizontal and at right side graph: vertical) | <p>Shows each output value as a grey color</p> <ul style="list-style-type: none"> <li>0 is shown as black</li> <li>maximum value that the current camera supports is shown as white</li> </ul> <p>Example of horizontal color bar:</p>  |    |

Table 34: LUT editor: window elements

| Window element                             | Description  | Examples, controls, buttons  |
|--|--|--|
| Histogram                                  | <p>Shows a histogram of the image with the applied LUT (only for 12-bit or 16-bit mode in Raw or Mono)</p> <p>Example of histogram Pike F-032C:</p>    |  |
| Scroll bars                                | Use the horizontal and vertical scroll bars for scrolling the graph when it is zoomed.   |  |
| Controls for zooming the graph             | Use these buttons to zoom in/out the graph or the current selection of the graph.  |   |
| Controls for saving the LUT data to a file | <p>Enter file name or choose already existing file to save LUT data.</p> <p>When deactivating <input type="checkbox"/> add X values check box the X value column will not be saved in the *.csv file.</p> <p> <b>Caution:</b> If working with multi-column *.csv files: <b>Never use the Save button in the LUT editor, unless using a new file name. Only the displayed column is saved, all other columns get lost.</b></p> |  |

Table 34: LUT editor: window elements

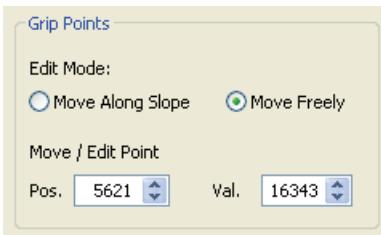

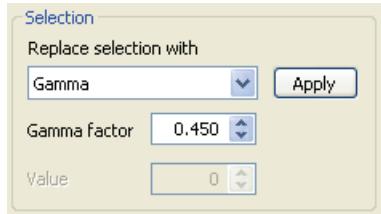

| Window element  | Description   | Examples, controls, buttons   |
|---|---|---|
| Controls for editing grip points                          | <p>On start-up of LUT editor there are already 2 so-called grip points set which are connected with a line (linear function). You can add/delete/move grip points.</p> <p>There are two moving methods: <b>Move Along Slope</b> and <b>Move Freely</b> (default). Additionally you can enter position and value for each grid point manually.</p> <p>For details see:</p> <ul style="list-style-type: none"> <li>• Chapter LUT editor: <a href="#">How to add a grip point</a> on page 98</li> <li>• Chapter LUT editor: <a href="#">How to remove a grip point</a> on page 99</li> <li>• Chapter LUT editor: <a href="#">How to move/edit a grip point</a> on page 99</li> </ul> |    |
| Controls for replacing a selection with special functions | <p>You can also replace a selection with a number of values or special functions (line, gamma, inversion, etc.) by clicking <b>Apply</b>.</p> <p>For details see:</p> <ul style="list-style-type: none"> <li>• Chapter LUT editor: <a href="#">How to select data</a> on page 97</li> <li>• Chapter LUT editor: <a href="#">How to extend a selection of data</a> on page 98</li> <li>• Chapter LUT editor: <a href="#">How to modify the graph between two grip points</a> on page 100</li> </ul>  |  |

Table 34: LUT editor: window elements

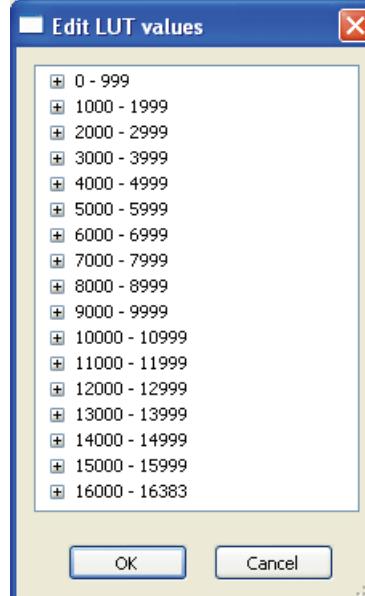

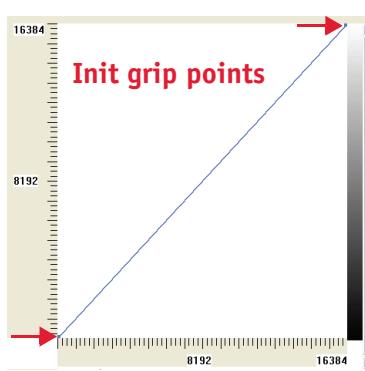

| Window element  | Description   | Examples, controls, buttons   |
|---|---|---|
|    | Click here to open the <b>Edit LUT values</b> dialog and change each value individually.  | Example of dialog for Pike F-210C<br>           |
|  | Click <b>Init</b> to start with two grip points connected with a linear graph. The two initial grip points are (0,0) and (max, max). <ul style="list-style-type: none"> <li>• Left starting grip point is set to null by default.</li> <li>• Right starting grip point is set to the maximum LUT value by default.</li> <li>• The two starting grip points are connected by a straight line (linear) from null to the maximum LUT value.</li> </ul> | Example of init function with Pike F-032C:<br> |

Table 34: LUT editor: window elements

| Window element  | Description  | Examples, controls, buttons  |
|---|--|--|
|  and <br><b>Undo</b> and <b>Redo</b> button | <ul style="list-style-type: none"> <li>Click  <b>Undo</b> to let the last modification of the LUT data be undone.</li> <li>Click  <b>Redo</b> to let the Undo action be undone.</li> </ul> | Use  <b>Undo</b> and  <b>Redo</b> buttons to traverse through the whole history of modifications with two limitations: <ul style="list-style-type: none"> <li>If the LUT data is modified after undoing some actions, these actions cannot be redone.</li> <li>If the LUT editor is closed and reopened, it is not possible to undo the actions made before closing the dialog.</li> </ul> |

|  | <b>Example of edited LUT:</b><br> | Corresponding <b>Preview</b> image in SmartView window:<br>   |

Table 34: LUT editor: window elements

### LUT editor: How to select data

#### Note

With the introduction of the new grip point mechanism a region selection is only possible from grip point to grip point.

To start: click **Init**. The first two grip points are created with a linear graph between them.

To select a region (range of values between two adjacent grip points):

1. In the graph window click (with left mouse button) **outside the line**.
2. Keep left mouse button pressed and move cursor (to the right or left).

3. Release left mouse button to end selection.

The two adjacent grip points that are next to the so-marked region are taken for the current selection.

The current selection is displayed with grey background color. The elements in the **Selection** section are now available. (For more information see Chapter [LUT editor: How to modify the graph between two grip points](#) on page 100.)

To deactivate the current selection: click in grey background.

### **LUT editor: How to extend a selection of data**

To extend a current selection:

1. Click on the vertical edge of a current selection (with grey background color) and keep left mouse button pressed.

Mouse cursor changes to double-headed arrow.

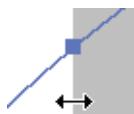

Figure 18: Extend current selection with mouse cursor

2. Move the cursor to right or left until it snaps to the next grip point.
3. Release the left mouse button to fix the new selection.

**Note**

If necessary: First add a new grip point to which the selection can be extended.

### **LUT editor: New grip point mechanism**

In order to simplify the handling and editing of look-up tables a new mechanism with grip points was implemented. The usage is described in the following subsections.

#### **LUT editor: How to add a grip point**

To add a grip point:

1. Right-click on the graph.

In the popup menu click **Insert Grip Point**.

A grip point is added directly on the graph.

### LUT editor: How to remove a grip point

**First way** To remove a grip point:

1. Right-click the grip point.
2. In the pop-up menu click on **Remove Grip Point**.

The grip point is removed.

**Second way** To remove a grip point:

1. Move grip point onto another grip point.
2. The grip point is removed automatically.

### LUT editor: How to move/edit a grip point

**First way** To move a grid point (**Move Along Slope** method):

1. Click on the grid point.

The mouse cursor changes to  and the color of the grid point changes from blue to orange.

2. In **Grip Points** section choose **Move Along Slope** option.

In graph window click on orange grid point and keep left mouse button pressed.

Mouse cursor changes to 

3. Move the cursor (horizontally to right or left).

The grid point moves along the slope of the graph.

**Note**

If the grid point is moved onto another grip point, it is removed automatically.

4. Release the left mouse button to fix the grip point at the new position.

**Second way** To move a grid point (**Move Freely** method):

1. Click on the grid point.

The mouse cursor changes to  and the color of the grid point changes from blue to orange.

2. In **Grip Points** section choose **Move Freely** option.

3. In graph window click on an existing grip point and keep left mouse button pressed.

Mouse cursor changes to 

4. Move the cursor right/left or up/down.

The grip point moves in the same direction as the mouse cursor.

**Note** When moving a grip point, the graph lines connected to the moving point are set back to linear function.

5. Release the left mouse button to fix the new position of grip point.

### LUT editor: How to modify the graph between two grip points

To select and modify LUT data:

1. Select data as described in Chapter [LUT editor: How to select data on page 97](#) and Chapter [LUT editor: How to extend a selection of data on page 98](#).
2. If the selection of data is done, proceed in the following way to modify the LUT data.
3. In the **Selection** area use the **Replace selection with** combo box:

| Choosing Modify method...      | ... does the following   | Replace  |
|--------------------------------|--|--|
| Value                          | ... replaces the selection with a fixed value.<br>Enter this value in the <b>Value</b> field or use  .  | All actions are done by clicking <b>Apply</b> in the <b>Selection</b> section. |
| Minimum value or Maximum value | ... changes the selection to either 0 or the maximum value supported by the camera.  |  |
| Left value or Right value      | ... sets the selection to the first or last selected value.  |  |
| Average value                  | ... replaces the selection by its average value.   |  |
| Line                           | ... replaces the selection by a straight line from the first to the last selected value.   |  |
| Gamma                          | ... replaces the selection by a gamma function from the first to the last selected value.<br>Enter the gamma factor in the Gamma factor field or use  . |  |
| Inversion                      | ... mirrors the current selection vertically.<br>The baseline for the mirroring is the first selected value.   |  |

Table 35: Modify methods

#### 4. Click **Apply**.

The chosen modify method is applied to the selection in LUT editor window. If **Preview** check box is activated the chosen method is also applied on-the-fly to the image in SmartView window.

## Working with trigger

### Conditions

- During HDR mode level mode trigger (Trigger\_Mode\_1) is not possible.
- The multi-shot counter also controls the number of shots in Trigger\_Mode\_15.

### Where to find

SmartView: Main window:  Edit settings → Trig/IO tab

Configure  
trigger and  
input/output

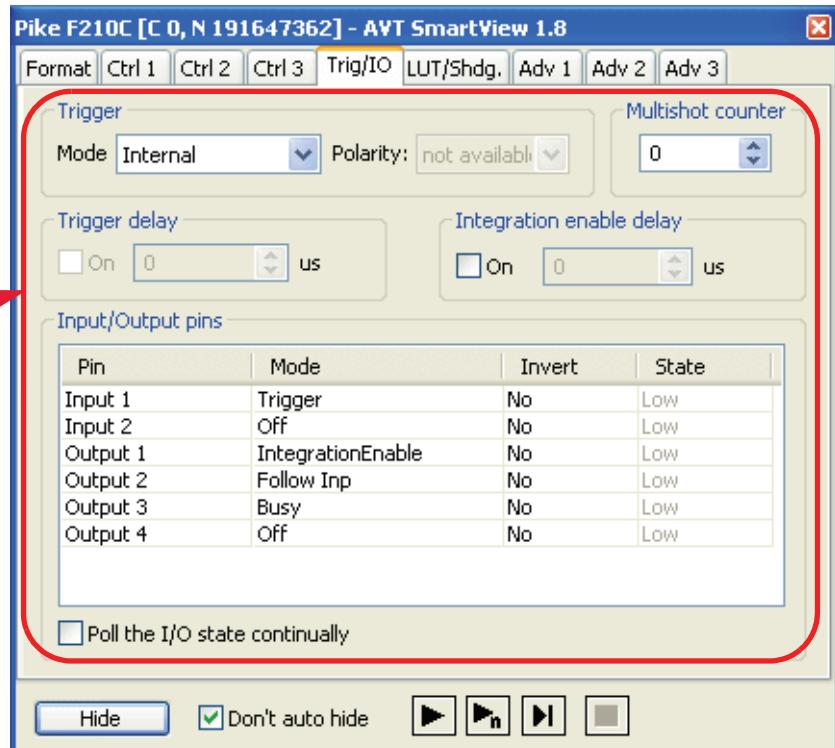

Figure 19: Trigger and Input/Output: Example (Pike F-210C)

## Description

All AVT cameras support IIDC conforming Trigger\_Mode\_0 and Trigger\_Mode\_1 and special Trigger\_Mode\_15 (bulk trigger).

Stingray/Guppy PRO cameras support software triggers (AVT-own feature) additionally: marked with -SW.

| Trigger mode                              | ...also known as                     | Description   |
|---|--------------------------------------|---|
| Internal                                  | Continuous mode                      | The camera runs with an internally generated trigger.<br><br>The camera sets the shutter time according to the value set in the shutter (or extended shutter) register.   |
| Edge mode(0)-Ext<br>Edge mode(0)-SW       | Edge mode<br>Trigger_Mode_0          | The camera triggers one image precisely (aka asynchronously) with a voltage edge received via trigger pin of the I/O connector.<br><br>The camera sets the shutter time according to the value set in the shutter (or extended shutter) register.   |
| Level mode(1)-Ext<br>Level mode(1)-SW     | Level mode<br>Trigger_Mode_1         | The camera triggers one image precisely (aka asynchronously) with a voltage edge received via trigger pin of the I/O connector.<br><br>The camera sets the shutter time according to the active low time of the pulse applied (or active high time in the case of an inverting input).<br><br>The trigger signal thus serves <b>dual</b> purposes: <ul style="list-style-type: none"> <li>• First to set the trigger moment and</li> <li>• secondly to instruct the camera how long to shutter (integrate).</li> </ul> Use this mode for overriding the 67 seconds long time integration limit or if you need to adapt to brightness changes but without using the shutter register and software calls. |
| Progr. mode(15)-Ext<br>Progr. mode(15)-SW | Programmable mode<br>Trigger_Mode_15 | Is a <b>bulk trigger</b> , combining one external trigger event with continuous or one-shot or multi-shot internal trigger.   |

Table 36: Description of trigger modes

## **Configuring trigger modes**

- Perform steps** To configure the trigger modes do the following:
1. In [Trigger](#) section choose your desired mode (Internal, Edge mode(0), Level mode(1), Progr. mode(15)).
  2. For Edge mode(0) or Progr. mode(15) choose the **Polarity** of the trigger signal (**Falling** or **Rising**). For level mode(1) choose the **Polarity** of the trigger signal (**Low act.** or **High act.**).
  3. In [Multishot counter](#) section set the number of images for the camera to take in succession.
  4. If you choose Edge mode(0): In [Trigger delay](#) section you can set a trigger delay (activate **On** check box) and a delay time in  $\mu\text{s}$  for the trigger signal to become effective.
  5. In [Integration enable delay](#) section you can switch on/off (**On** check box) the delay of the integration enable event. Enter the delay time in  $\mu\text{s}$ . Use this e.g. if you fire a flash with IntEna and want to delay when the flash is fired relative to the trigger.
  6. In [SW trigger](#) section you can set a software trigger (click **Trigger**).

### Scenarios for trigger modes

The following scenarios show some examples when the three trigger modes are useful.

| Trigger mode    | Typical scenario  | Additional information  |
|-----------------|---|---|
| Trigger_Mode_0  | Moving objects to be triggered precisely at the same position.  | Motion blur (the amount of movement during the shutter is open) may also affect the image quality. Thus a controlled and bright illumination (or flash driven by IntEna signal of camera) with a proper and short shutter time may be required. |
| Trigger_Mode_1  | <ul style="list-style-type: none"> <li>• Moving objects to be triggered precisely at the same position.</li> <li>• Brightness changes to be controlled via the trigger signal itself.</li> </ul>  | This mode emulates the behavior of popular analog cameras.  |
| Trigger_Mode_15 | <ul style="list-style-type: none"> <li>• Grabbing exactly one image based on the first external trigger.</li> <li>• Filling the camera's internal image buffer with one external trigger without overriding images. (By setting Multi_shot counter = #frames fitting in internal memory)</li> <li>• Grabbing an unlimited amount of images after one external trigger (surveillance)</li> </ul> | The <b>Technical Manuals</b> of the cameras have in depth examples how to set up these three examples.  |

Table 37: Typical scenarios for trigger modes

### Configuring input/output pins

Each input pin and each output pin can be configured individually to your needs for example the above mentioned triggering of the cameras.

**Perform steps** To configure the input/output pins do the following:

1. In [Input/Output pins](#) section choose for every input and output pin the desired mode. To change a mode, click on the mode field. A combo box opens: click on the desired mode.

For each pin you can choose one of the following modes:

Input ⇒ (Off/Trigger)

Output ⇒

(Off/Direct/IntegrationEnable/FrameValid/Busy/FollowInp)

2. Choose the Polarity bit in the **Invert** column. To change an Invert entry, click on the invert field. A combo box opens: click on **No** or **Yes** to change the Polarity bit.

**Note**

The former **Polarity** column for the input/output pins is now called **Invert** to clarify the use of this bit. A polarity of **low** in former SmartView versions is now read as Invert:**No**, meaning the same.

If you set more than one input for trigger, all inputs are logically ANDed.

The **State** column lists the status of the input/output pin (**Low** or **High**).

3. Activate  **Poll the I/O state continually** to update the state of pins every 200 ms.

## **Using logging functionality of SmartView (\*.cmd file)**

### **Conditions**

- Appropriate start option must be supplied.
- Log file is created in folder of viewer executable.

### **Where to find**

Has to be done manually. See Description.

### **Description**

SmartView provides a logging facility for errors that might have occurred during the operation of the program. This is helpful if you want to debug problems in cooperation of the software with the cameras and the associated hardware in question.

- The logging file is created only if an appropriate start option is supplied.
- The log file is created in the same folder as the viewer executable.

There are two options for the log file:

- It is only flushed every 8000 characters or after closing SmartView.
- It is auto-flushed when needed.

Setting via **Extras → Auto-flush logging file** (May slow down system). See Submenue [Auto-flush logging file](#) on page 35.

The following log levels are listed in decreasing severity and include all the log levels above them:

- "-d": debug
- "-e": error
- "-w": warning
- "-i": info

There are two ways to use the logging functionality:

- First way** Place a link to SmartView on the desktop and modify the properties of the link accordingly.

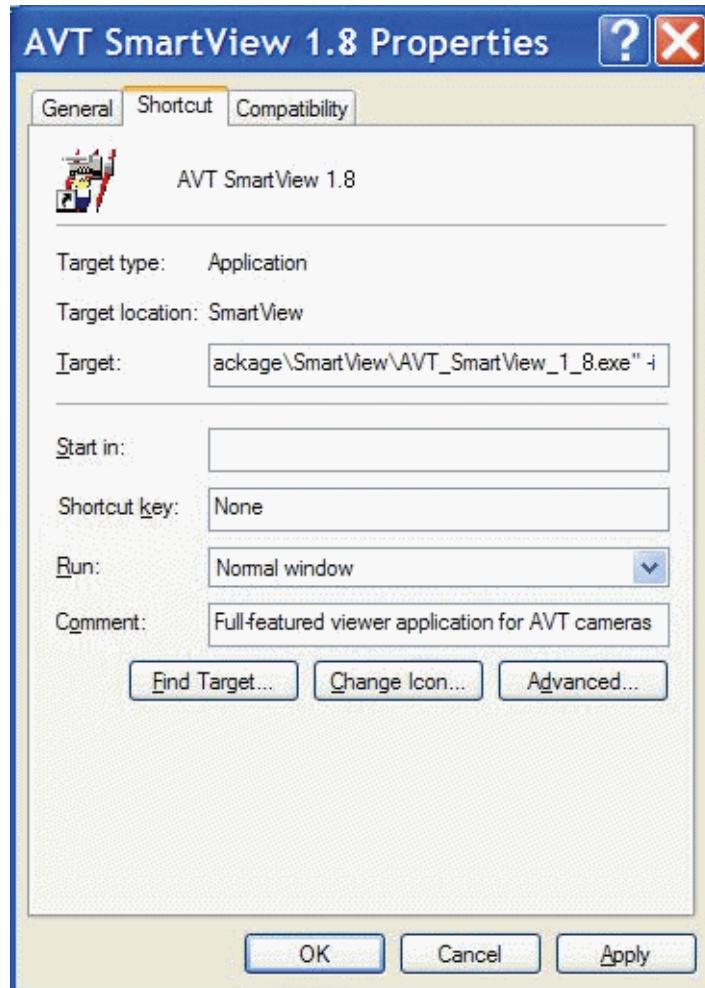

Figure 20: Properties dialog of SmartView

- Second way** Alternatively create a \*.cmd file with the options (e.g. SmartView.exe -i) in the SmartView directory.

Figure 21: SmartView.cmd file

## Channel balance (only Pike)

### Conditions

- All KODAK Pike sensors: channel balance  
(color cameras: Format\_7 mode and RAW mode/no debayering)  
(b/w cameras: Format\_7 mode and Mono mode)

### Where to find

Channel balance: Extras → Adjust channels

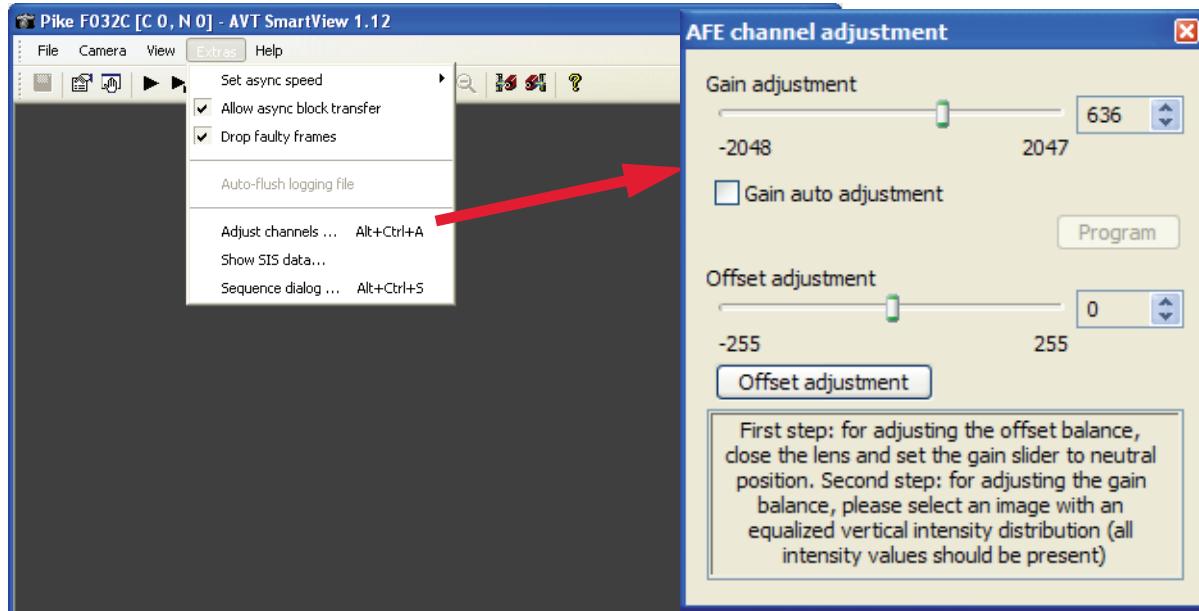

Figure 22: Channel balance: Example (Pike F-032C)

### Description

#### Pike channel balance

##### Technical background

To achieve more speed, the Kodak sensors of the Pikes are read out horizontally via two separate channels, so two ADCs are involved which may have to be configured differently. A standard adjustment between the channels is done at production time, but under certain circumstances, an intensity step might still be visible from left to right.

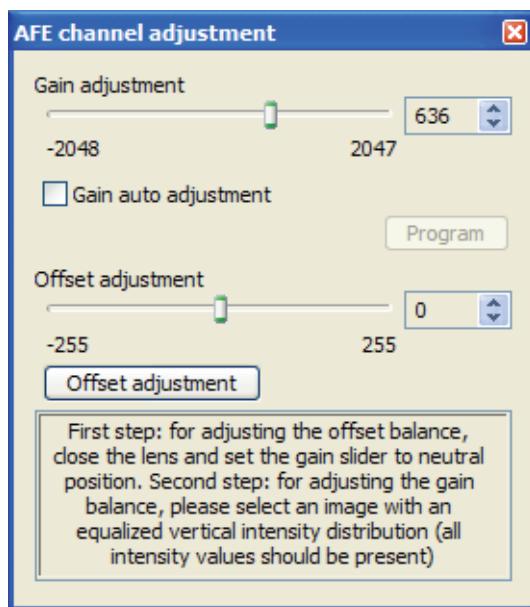

##### Perform steps

To be able to make the step disappear, there is an extra dialog available from the viewer window.

To carry out an adjustment (offset adjustment + gain adjustment) in SmartView, perform the following steps:

1. In SmartView click **Extras → Adjust channels...** or use Alt+Ctrl+A.

The following window opens:

2. Put on lens cap.
3. Set gain adjustment slider and offset adjustment slider to 0.
4. Click several times **Offset adjustment** until the slider does not move any more.
5. Put off lens cap.
6. Take test sheet with vertical continuous b/w gradient, defocus lens and start image acquisition.
7. Activate **Gain auto adjustment**.

Now left and right channel should be adjusted for all grey values, so that vertical line is no more visible.

**Note**

Channel adjustment should be done in the same gain region as in your real application. If you use a much greater gain in your application, it may be necessary to do the dual-tap offset adjustment again.

Dual-tap offset adjustment is done once in the AVT factory and saved via **Program** button in User set 0.

The **Program** button is not available for the user.

**Note**

For more information read **Pike Technical Manual**, Chapter **Channel balance**.

## Using HDR mode (CMOS cameras)

### Conditions

- Guppy F-036: HDR mode of Micron MV022 sensor
- Marlin F-131: HDR mode of FillFactory IBIS5B sensor
- For HDR mode: number of knee points must be greater 0.

### Where to find

HDR:  Edit settings → CMOS tab, Section High dynamic range mode

**Configure HDR**

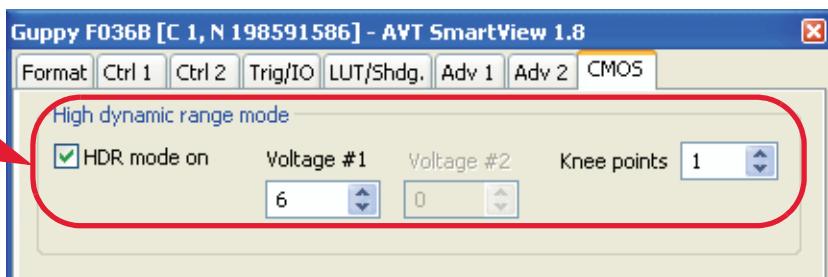

Figure 23: HDR mode: Example (Guppy F-036B)

### Description

#### Guppy F-036: Micron MV022 HDR mode

##### Technical background

The **HDR mode** of the **Micron MV022** sensor allows for **two** knee points. They are controllable in an **easy mode**, which means that the draining voltage may be set for both knee points (measured from the minimum voltage) and the time is assigned automatically by the sensor.

##### Perform steps

On **CMOS** tab:

1. Enter voltage levels from 0 to 31.  
A value of 0 means 0.5625 Volt (each step meaning an increase of 0.0625 Volt).
2. If you select two knee points, the second value must be less than or equal to the first value.

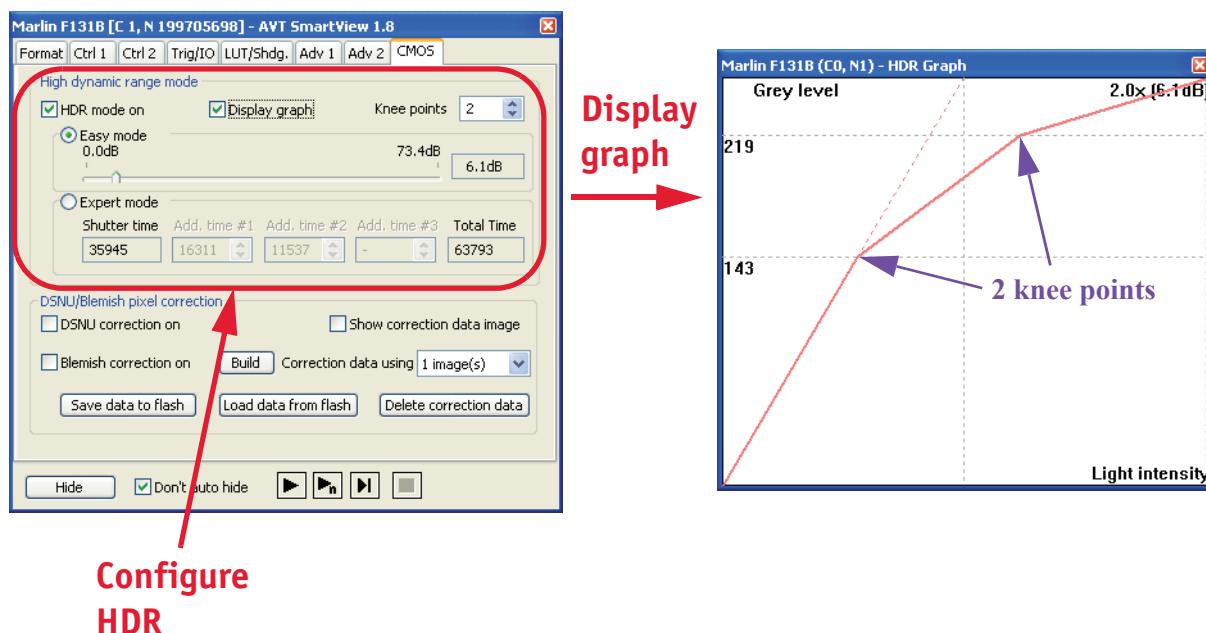

**Note**

For more information read:

- Chapter [CMOS tab descriptions](#) on page 58, Section **High dynamic range mode (only Guppy F-036)**
- [Guppy Technical Manual](#), Chapter **HDR (high dynamic range) (Guppy F-036 only)** [approx. 5 pages]

**Marlin F-131: IBIS5B HDR mode**

The **HDR mode** of the **IBIS5B** sensor allows for **three** knee points. This enables the high dynamic range of the sensor to be compressed into 8 bit, preserving interesting details of the image. This mode is also known as multiple slope (dual slope).

**Configure HDR**

Figure 24: HDR mode of Marlin F-131B (2 knee points + Easy mode + Display graph)

**Perform steps** On **CMOS** tab:

1. Change number of knee points to value greater 0 (Example: 2).
2. Activate **HDR mode on** check box.
3. In **Easy mode** put slider in the desired position (the knee point values will be set automatically).  
In **Expert mode** enter values for **Add.time #1 (#2, #3)** manually.
4. Activate **Display graph** check box to display the **HDR Graph** window.

**Note**

For more information read:

- Chapter [CMOS tab descriptions](#) on page 58, Section **High dynamic range mode (only Marlin F-131)**
- **Marlin Technical Manual**, Chapter **IBIS5A multiple slope (High Dynamic Range mode)**.

## Error Messages and FirePackage Error Flags

We analyze and discuss the data flow from an AVT camera (e.g Marlin) to the main memory of a PC under Windows™ using **AVT FirePackage** assuming a **FireGrab** or **FireStack** based implementation like e.g. SmartView. First we notice a frame buffer in the camera, which can hold usually more than one image in the camera. The frame memory is constructed as a FIFO (first in first out) memory. Frame buffer(s) in a camera are beneficial for the sensor handling as well as for additional features (such as deferred image transfer). A frame buffer in the camera is not primarily intended or needed for secure data flow aspects.

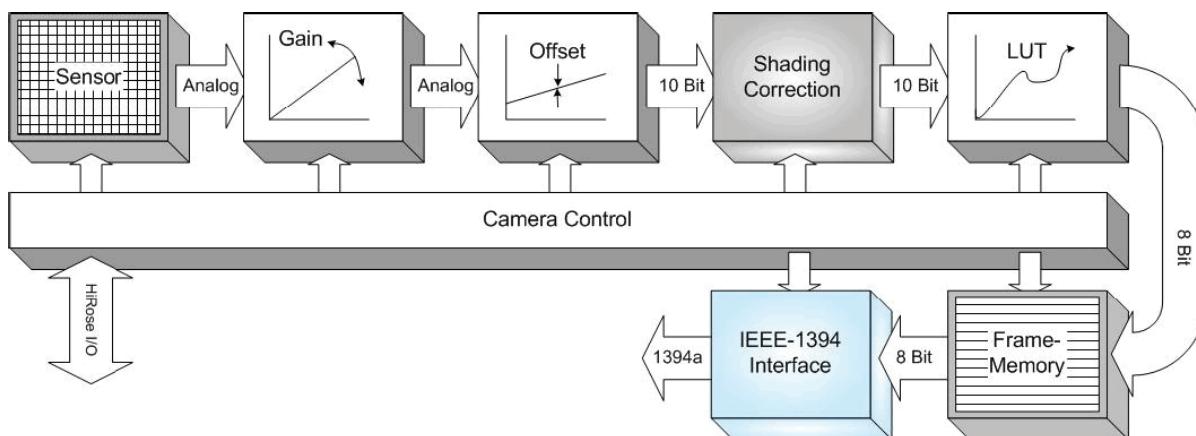

Figure 25: Block diagram Marlin b/w camera

The frame memory is followed by a much smaller FIFO buffer (size of 4 kByte) in the 1394 interface (link chip) to buffer the data prepared to send of about one 1394 cycle.

Data then is sent via a DMA mechanism to the corresponding 1394 receive buffer in the PC, which has also usually the size of 4 kByte.

Speed of the PCI (express) bus is high enough and latency of it is usually very low so that no overflow or underflow of Receive-FIFO is occurring.

A block diagram of the incoming receive OHCI chip (by TI) interface shows the details:

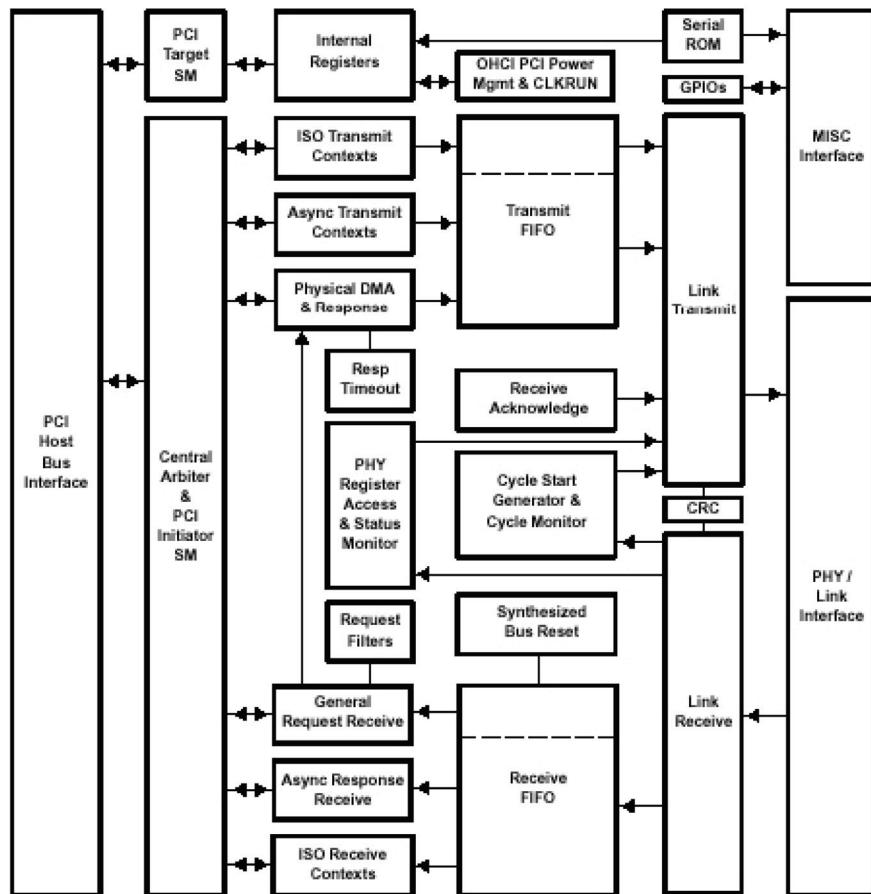

Figure 3–1. TSB12LV26 Block Diagram

Figure 26: Block diagram of incoming receive OHCI chip (by TI)

If an error occurs, the Receive FIFO is most probably the critical section.

Other devices of the PC, such as network adapter or USB or peripheral devices may also occupy the PCI bus so that the performance for the 1394 part can be negatively influenced or becomes too low.

Debugging this situation requires the temporal deactivation of these peripheral devices accompanied by lowering the packet payload of the 1394 device.

With the use of **MS low level device driver for 1394 ports**, errors in the low level data flow which are created by the hardware such as Receive-FIFO overflows are **not** reported to the application.

**FirePackage** on the other hand replaces the MS device driver by a specific (monolithic) driver for the 1394 device class which fully reports errors to the application. The following is a list of the various error messages, generated by the driver and the associated dlls.

**Note**

While it is not the purpose of this document to explain each and every theoretically possible error, it might be helpful in the event of debugging to communicate the exact error messages to the support staff.

## Error codes returned by functions

Every function returns a 32-bit error code that contains additional information about the error.

The module differs between upper layer error codes (that start with FCE\_XXX) and low level error codes that start with (HALER\_XXX).

The following two tables show the coding and describes each error.

### **HALER\_XXX codes**

| Error name           | Number | Error description  |
|----------------------|--------|--|
| HALER_NOERROR        | 0      | No error.  |
| HALER_NOCARD         | 1      | No hardware found.   |
| HALER_NONTDEVICE     | 2      | No logical device could be created for the card (memory problem).  |
| HALER_NOMEM          | 3      | Not enough memory for this operation.  |
| HALER_MODE           | 4      | Wrong mode for this operation.   |
| HALER_TIMEOUT        | 5      | Time-out occurred.   |
| HALER_ALREADYSTARTED | 6      | Device was already started and cannot be started twice.  |
| HALER_NOTSTARTED     | 7      | Device was not started.  |
| HALER_BUSY           | 8      | Device is busy at present.   |
| HALER_NORESOURCES    | 9      | Not enough resources (no more interrupts, no threads etc.).  |
| HALER_NODATA         | 10     | There is no data to acquire.   |
| HALER_NOACK          | 11     | No acknowledge received from the target.   |
| HALER_NOIRQ          | 12     | Expected an interrupt but there was none.  |
| HALER_NOBUSRESET     | 13     | Expected a firewire bus reset but there was none.  |
| HALER_NOLICENSE      | 14     | No license to perform this action.   |
| HALER_RCODEOTHER     | 15     | Response code of target for actual requested subaction other then RCODE_COMPLETE (response code is also returned). |
| HALER_PENDING        | 16     | Something has been started and is in a pending state.  |

Table 38: HALER\_XXX codes

| Error name           | Number | Error description   |
|----------------------|--------|---|
| HALER_INPARMS        | 17     | Error in input parameter (mostly range error).  |
| HALER_CHIPVERSION    | 18     | Wrong chip version for this function.   |
| HALER_HARDWARE       | 19     | Hardware error.   |
| HALER_NOTIMPLEMENTED | 20     | Function is not implemented.  |
| HALER_CANCELLED      | 21     | A waiting function was cancelled by another user call.  |
| HALER_NOTLOCKED      | 22     | A device is unlocked and needs to be locked for this action.  |
| HALER_GENERATIONCNT  | 23     | A function for asynchronous communication was called after a bus reset without having called <FCTLGetBus-Info> in order to get the new addresses of all existing nodes. |
| HALER_NOISOMANAGER   | 24     | Function requires an isochronous resource manager but there is none.  |
| HALER_NOBUSMANAGER   | 25     | Function requires a bus manager but there is none.  |
| HALER_UNEXPECTED     | 26     | Internal processing error, unexpected value detected.   |
| HALER_REMOVED        | 27     | Target for command was removed.   |
| HALER_NOBUSRESOURCES | 28     | Either no isochronous channel or isochronous bandwidth available.   |
| HALER_DMAHALTED      | 29     | An isochronous receive DMA has been halted.   |

Table 38: HALER\_xxx codes

**FCE\_xxx codes**

| Error name          | Number | Error description   |
|---------------------|--------|---|
| FCE_NOERROR         | 0      | No error  |
| FCE_ALREADYOPENED   | 1001   | Device is already open and cannot be opened twice.                    |
| FCE_NOTOPENED       | 1002   | Device must be opened before.   |
| FCE_NODETAILS       | 1003   | No details for this error   |
| FCE_DRVNOTINSTALLED | 1004   | Kernel mode driver not installed.                                     |
| FCE_MISSINGBUFFERS  | 1005   | Not enough buffers for the requested isochronous communication.       |
| FCE_INPARMS         | 1006   | Error in input parameters (mostly range error).                       |
| FCE_CREATEDevice    | 1007   | Error creating a logical device to connect to the kernel mode driver. |
| FCE_WINERROR        | 1008   | Internal windows error.   |
| FCE_IOCTL           | 1009   | Error while calling kernel mode driver.                               |

Table 39: FCE\_xxx codes

| Error name          | Number | Error description   |
|---------------------|--------|---|
| FCE_DRVRETURNLENGTH | 1010   | Data returned from kernel mode driver has wrong length (version problem). |
| FCE_INVALIDHANDLE   | 1011   | Handle has invalid value.   |
| FCE_NOTIMPLEMENTED  | 1012   | Function is not implemented.  |
| FCE_DRVRUNNING      | 1013   | Kernel mode driver runs already.  |
| FCE_STARTERROR      | 1014   | Kernel mode driver could not be started.                                  |
| FCE_INSTALLERROR    | 1015   | Kernel mode driver could not be installed.                                |
| FCE_DRVVERSION      | 1016   | Wrong version of kernel mode driver.                                      |
| FCE_NODEADDRESS     | 1017   | Error in node address specified.  |
| FCE_PARTIAL         | 1018   | User supplied buffer was only filled partially (buffer was too small).    |
| FCE_NOMEM           | 1019   | Not enough memory for this request.                                       |
| FCE_NOTAVAILABLE    | 1020   | The requested function is not available.                                  |
| FCE_NOTCONNECTED    | 1021   | The object is not connected to a real target.                             |
| FCE_ADJUSTED        | 1022   | One of the parameters had to be adjusted.                                 |

Table 39: FCE\_xxx codes

### Error flags in global error field

Error codes are returned when a function is called. Error flags are something different. During processing in the background there is a potential risk that an error occurs. This error can not be assigned to any function. So these are handled by the error flags. One or more error flags are set when an error occurs and are stored within a 32-bit field.

When an application wants to be notified this bit field is posted to the application with an WPARAM\_ERROR message. In the 32-bit field each bit has a specific meaning. The following table shows the bit values and explains their meaning.

### HALERF\_xxx

| Error name       | Value      | Error description                     |
|------------------|------------|---------------------------------------|
| HALERF_RXHLTIS00 | 0x00000001 | Isochronous RXDMA0 had to be stopped. |
| HALERF_RXHLTIS01 | 0x00000002 | Isochronous RXDMA1 had to be stopped. |
| HALERF_RXHLTIS02 | 0x00000004 | Isochronous RXDMA2 had to be stopped. |
| HALERF_RXHLTIS03 | 0x00000008 | Isochronous RXDMA3 had to be stopped. |
| HALERF_RXHLTIS04 | 0x00000010 | Isochronous RXDMA4 had to be stopped. |
| HALERF_RXHLTIS05 | 0x00000020 | Isochronous RXDMA5 had to be stopped. |

Table 40: HALERF\_xxx

| Error name          | Value      | Error description   |
|---------------------|------------|---|
| HALERF_RXHLTIS06    | 0x00000040 | Isochronous RXDMA6 had to be stopped.   |
| HALERF_RXHLTIS07    | 0x00000080 | Isochronous RXDMA7 had to be stopped.   |
| HALERF_ISORXACK     | 0x00000100 | Isochronous DMA reported error in packet ACK                                    |
| HALERF_ISORX        | 0x00004000 | Unspecified isochronous receive error.  |
| HALERF_TXRESPONSE   | 0x00008000 | Could not send a response for a request (Read or Write).                        |
| HALERF_ASYRX        | 0x00010000 | Error during asynchronous reception.  |
| HALERF_ASYTX        | 0x00020000 | Error during asynchronous transmission.   |
| HALERF_PHYTIMEOUT   | 0x00040000 | The Phy took to long to transfer an information to the Linklayer chip.          |
| HALERF_HDRERROR     | 0x00080000 | A packet with an unknown header was received.                                   |
| HALERF_TCERROR      | 0x00100000 | Packet with unknown TCode was received.   |
| HALERF_ATSTUCK      | 0x00200000 | Asynchronous transmit FIFO stucked.   |
| HALERF_GRFOVERFLOW  | 0x00400000 | General receive FIFO overflowed (access to PCI bus too slow)                    |
| HALERF_ITFUNDERFLOW | 0x00800000 | Isochronous transmit FIFO underflow (access from PCI bus too slow)              |
| HALERF_ATFUNDERFLOW | 0x01000000 | Asynchronous transmit FIFO underflow (access from PCI bus too slow)             |
| HALERF_PCIERROR     | 0x02000000 | Error while accessing PCI bus.  |
| HALERF_ASYRXRESTART | 0x04000000 | Error in asynchronous transmit state machine. Transmission had to be restarted. |
| HALERF_NOACCESSINFO | 0x08000000 | No access info could be allocated while an external access occurred.            |
| HALERF_SELFID       | 0x10000000 | Error while receiving SelfIds.  |
| HALERF_DMPORT       | 0x20000000 | Error in data mover port (GP-Lynx only)   |
| HALERF_ISOTX        | 0x40000000 | Error in isochronous transmission.  |

Table 40: HALERF\_xxx

## Setting AOI (Format\_7 settings)

**Definition** **AOI** = area of interest

Area of interest readout (AOI) refers to a camera function whereby only a portion of the available pixels are read out from the camera. For example, it is possible to read out a 640 x 480 pixel area of pixels from a camera that has a total resolution of 1628 x 1236. The result is a much faster frame rate and less data to be processed. This is also referred to as partial scan. Various autofunctions (auto shutter, auto gain, auto white balance) act on the AOI.

### Conditions

- Camera has to be in **Format\_7** mode

### Where to find

SmartView:  Edit settings → Format tab (Section **Format7 settings**)

Configure  
AOI

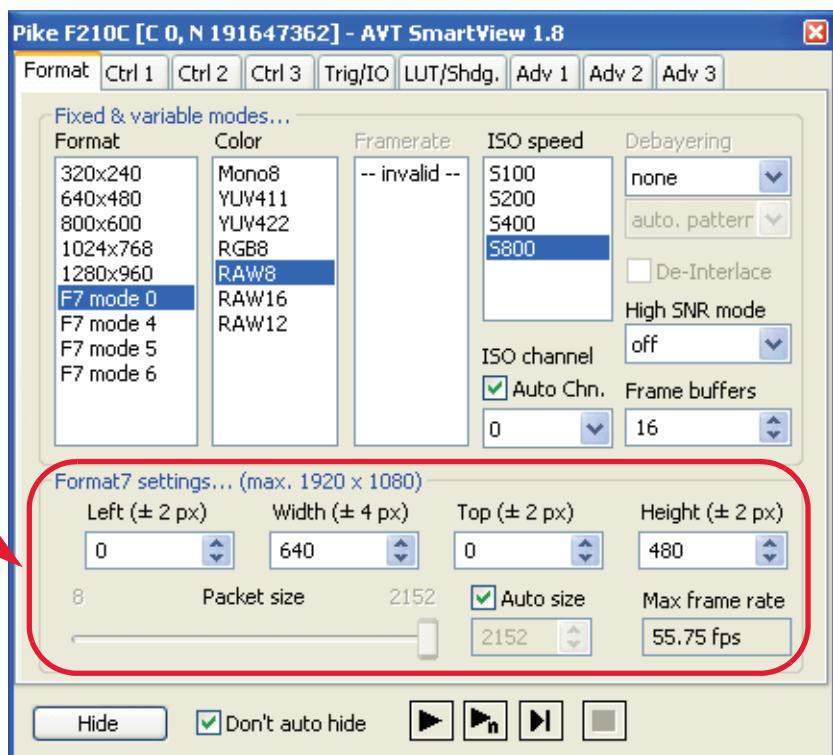

Figure 27: Setting AOI (Format\_7 settings): Example Pike F-210C

## Description

The image sensor on the camera has a defined resolution. This indicates the maximum number of lines and pixels per line that the recorded image may have.

However, often only a certain section of the entire image is of interest. The amount of data to be transferred can be decreased by limiting the image to a section when reading it out from the camera. At a lower vertical resolution the sensor can be read out faster and thus the frame rate is increased.

**Note** The setting of AOIs is supported only in video **Format\_7**.

While the size of the image read out for most other video formats and modes is fixed by the IIDC specification, thereby determining the highest possible frame rate, in Format\_7 mode the user can set the **upper left corner** and **width and height** of the section (AOI=area of interest) he or she is interested in to determine the size and thus the highest possible frame rate.

**SmartView** offers a convenient procedure for the selection of an AOI in the **Format** tab.

After selecting a Format\_7 mode the selection is available. You can choose a subwindow and its position according to your needs. IIDC specifies for Format\_7 that the transferred packet size has to be adjustable. This is reflected in the packet size slider which allows to limit the packet size (the amount of image data, which is transmitted from the camera every 125 microseconds). Lowering this packet size leads to a lower max. frame rate as displayed in the box.

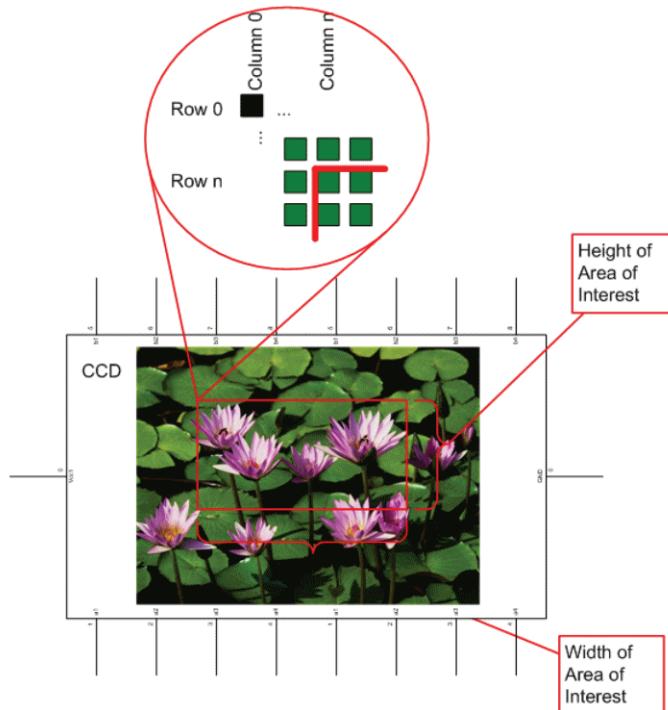

Figure 28: Area of interest (AOI)

In addition to the area of interest, some other parameters have an effect on the maximum frame rate:

- Time for reading the image from the sensor and transporting it into the FRAME\_BUFFER
- Time for transferring the image over the FireWire™ bus
- Length of the exposure time

# Calculating frames per second

## Conditions

- Acquiring images (one-shot, multi-shot, continuous)

## Where to find

**View → Status bar**

The current frame rate is displayed in the status bar.

Figure 29: Status bar: display of frame rate

## Description

AVT implemented a new frame rate calculation. The following chapter explains the difference between theoretical and displayed frame rate.

## New Frame rate calculation

In order to transfer the possible frame rate there is a new way to calculate the MaxBPP.

The maximum number of packets to be transferred with MaxFPS is determined. From this MaxBPP is calculated.

It is possible, that one cycle is dropped between two images. Nevertheless the frame rate formula can be used (**Technical Manual**, Chapter **Frame rates Format\_7**). MaxFPS of sensor will be reached.

## Example: calculation of frame rate (SmartView vs. Camera)

Calculation of MaxPPF:  $PPF = 1 / (\text{MaxFPS} \times 125\mu\text{s}) = 38.29$

Round off  $\Rightarrow PPF = 38$

Calculation MaxBPP:  $\text{MaxBPP} = 640 \times 480 / 38 = 8084.21$

This value will be rounded up to N-quadlets:  $\text{MaxBPP} = 8088$

**Caution**

SmartView calculates frame rate always according to the formula:

$$\text{frame rate} = 1 / ((\text{PPF} + 0.5) \times 125\mu\text{s})$$

Therefore SmartView will show a frame rate of

$$\text{frame rate} = 207.79 \text{ fps}$$

whereas the camera reaches a frame rate of approx. ~208.5

**Note**

If you choose other BPP than MaxBPP, then the calculated frame rate is the same as the former calculating method. So both calculating methods are compatible.

Pike F-032B, 640 x 480, Mono8, MaxFPSccd=208.93

## Status bar counters

Usually there is one counter to be seen at the bottom right hand side in the status bar of the viewing window which counts all frames sent from camera. Under practical circumstances it can happen that SmartView could not process and display all images from the camera or that even the driver could not reassemble all images from the camera.

### Conditions

This usually indicates problems in the hardware or the software such as

- Problems with the cabling (transmission errors)
- Bandwidth over the 1394 bus(es) exceeded
- PCI (Express) bus bandwidth exceeded
- PCI latency problems
- Problems with power consumption reduction options like **Intel Speed Stepping** or **AMD PowerNow** or **Cool'nQuiet**, resulting in overflows of receiving FIFO
- CPU resources problems

### Where to find

View → Status Bar

### Description

If there are three numbers displayed, not all frames arriving on the card could be processed and displayed.

- The **first** (left) **number** now shows the number of frames arrived at the card. (5077 in figure below)

- The **second number** shows the number of frames lost on driver level (e.g. due to receive FIFO overflows) (0 in figure below)
- The **third number** shows the number of frames lost due to poor processing capability. (37 in figure below).

The frame rates shown still show the frame rate at the card and, if there is a second frame rate, the right one shows the processed frame rate.

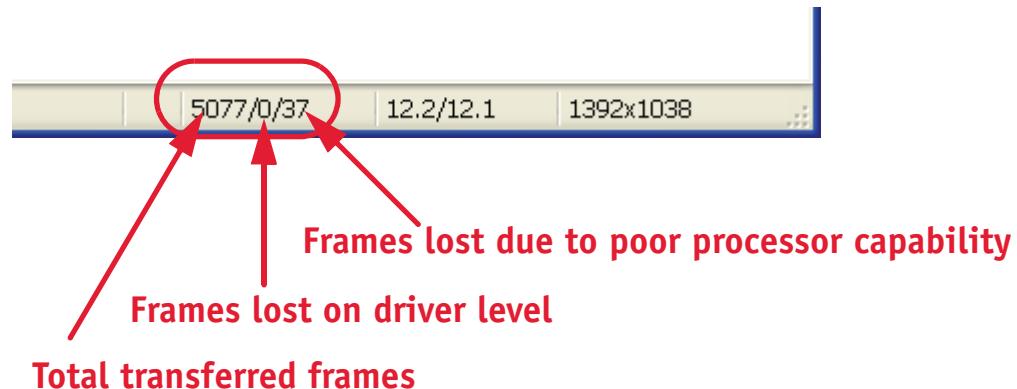

Figure 30: SmartView counters

**Note**

The screenshot shows one example which was produced in a **multi-camera environment** leaving the Bayer demosaicing to the PC and forcing it to the most challenging algorithms. As a consequence SmartView was not able on this PC to keep up with all the frames from the cameras.

## Format\_7 mode mapping (only Stingray/Pike/Guppy PRO F-503)

In Stingray/Pike/Guppy PRO (F-503) cameras, you can customize your Format\_7 layout with respect to binning (only b/w) or sub-sampling (b/w and color) via the so-called **Format\_7 mapping**.

Format\_7 Mode\_0 is factory setting (full resolution) and cannot be changed.

**Note**

For a detailed description of mapping to Format\_7 Mode\_1 ... Mode\_7 see **Stingray/Pike/Guppy PRO Technical Manual**, Chapter **Binning and sub-sampling access**.

### Conditions

- Binning: Stingray/Pike/Guppy PRO F-503 b/w camera
- Sub-sampling: Stingray/Pike/Guppy PRO F-503 b/w or color camera

### Where to find

SmartView entry window: Menu Camera → Format 7 mapping...

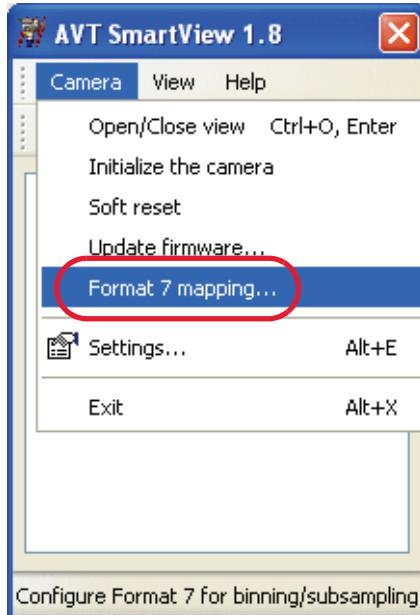

Figure 31: Format\_7 mode mapping

## Description

To map one or more modes to F7M1 ... F7M7 do the following:

1. In SmartView entry window click on **Camera → Format 7 mapping...**

The following window opens:

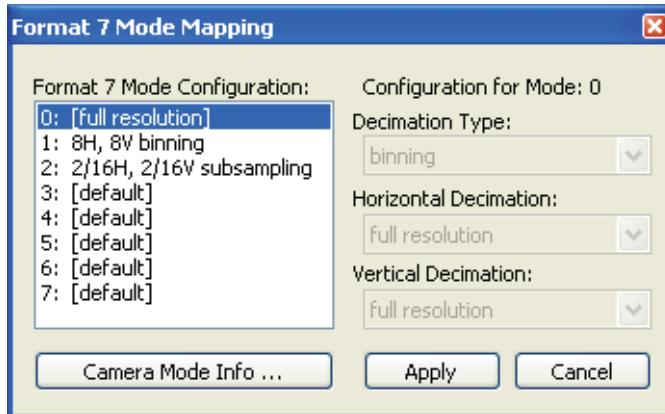

Figure 32: Format\_7 mode mapping window

2. Choose your mappings and click on **Apply**.

### Note

### Examples for abbreviations:

**H** means horizontal; **V** means vertical

**2H binning** means 2 x horizontal binning

**2/4 H sub-sampling** means 2 out of 4 horizontal sub-sampling

**F7M1** means Format\_7 Mode\_1

| Decimation Type | Description  |
|-----------------|--|
| Disabled        | Chosen mode disappears from the Format_7 mode list.  |
| Default         | Factory settings are used:<br><br>Pike cameras:<br><br>F7M1: 2H binning<br>F7M2: 2V binning<br>F7M3: 2H, 2V binning<br>F7M4: 2/4 H sub-sampling<br>F7M5: 2/4 V sub-sampling<br>F7M6: 2/4 H, 2/4 V sub-sampling |

| Sub-sampling    | Choose sub-sampling factor from combo boxes below. <ul style="list-style-type: none"><li>• full resolution</li><li>• 2/4</li><li>• 2/8</li><li>• 2/16</li></ul>  |

Table 41: Decimation types

For an overview of the available modes, click on **Camera mode info**.

For Pike cameras the following window opens:

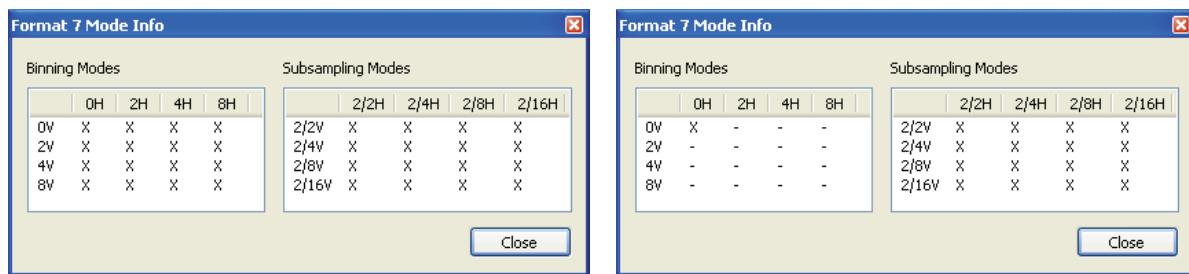

Figure 33: Camera mode info window (left: b/w; right: color Pike cameras)

When saving settings to an XML file, a hash value is calculated and stored for each Format\_7 mode, so that it is not possible to read illegal settings for a re-mapped mode. This has of course no impact on old settings files. In this case, illegal settings could be re-read.

## Packed 12-Bit Modes (only Stingray/Pike/Guppy PRO)

For Stingray/Pike/Guppy PRO cameras special **Packed 12-Bit modes** are available.

### Conditions

- Stingray/Pike/Guppy PRO b/w camera: MON012 (color ID 132)
- Stingray/Pike/Guppy PRO color camera: RAW12 (color ID 136)

### Where to find

SmartView:  Edit settings → Format tab (b/w: MON012; color: RAW12)

Packed 12-Bit Mode

Only 2x2 Debayering

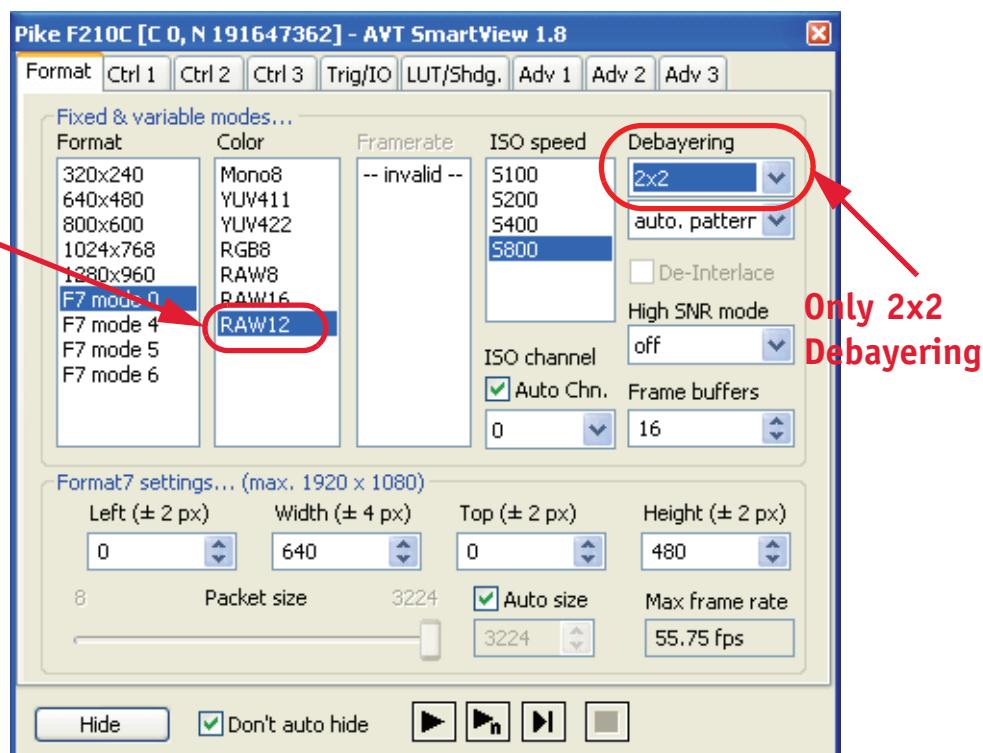

Figure 34: Format tab: Packed 12-bit Mode (Pike F-210C: RAW12)

### Description

The new **Packed 12-Bit Modes** are only available in Format\_7. At RAW12 color mode there is only 2x2 debayering available. For a detailed description see **Stingray/Pike/Guppy PRO Technical Manual**, Chapter **Packed 12-Bit Mode**.

## **Sequence mode (Stingray, Pike, Marlin)**

**Definition** **Sequence mode** is a concept where the camera holds a set of different image parameters for a sequence of images. The parameter set is stored volatile in the camera for each image to be recorded. This sequence of parameter sets is simply called a sequence. The advantage is that the camera can easily synchronize this parameter set with the images so that no uncertainty can occur.

### **Additional information**

For additional information on the **sequence mode** feature read the following chapters:

- **Stingray Technical Manual**, Chapter **Sequence mode**
- **Pike Technical Manual**, Chapter **Sequence mode**
- **Marlin Technical Manual**, Chapter **Sequence mode**

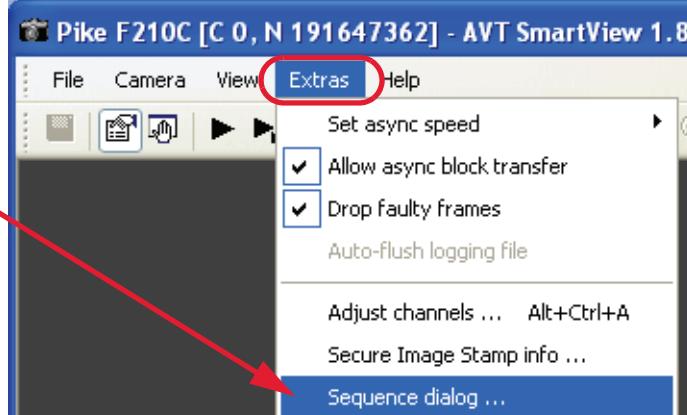

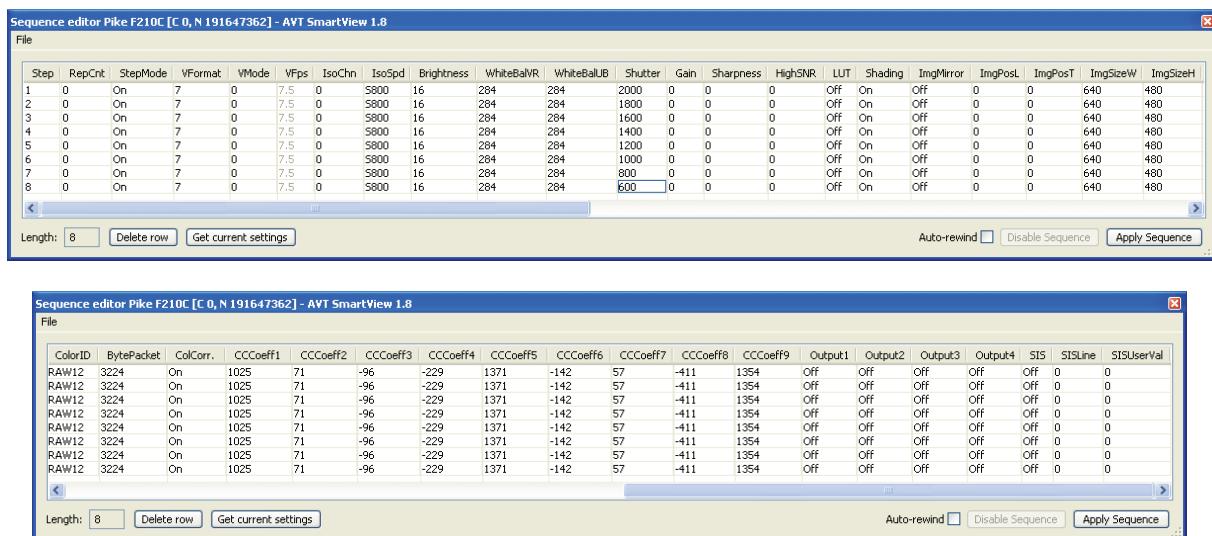

### **Conditions**

- Stingray camera
- Pike camera
- Marlin camera

## Where to find

Extras → Sequence dialog...

**Open Sequence editor**

Figure 35: Sequence editor: example for eight different image settings

## Description

### Perform steps

We show you an **example** how to work with the sequence editor (see screenshots above). Our aim is to set up a sequence with eight different image settings (varying shutter from 1000...300 in steps of 100).

1. In SmartView main window click **Extras → Sequence dialog...**

The **sequence editor** opens.

2. Click **Get current settings**.

The currently valid camera settings are gathered and put:

- into the row, in which the mouse cursor is currently positioned or
- after the last row (if no row element is selected)

3. Click 7x **Get current settings**.

You now have a list of 8 identical rows, named Step 1...8 (first column). All parameters that are part of sequence steps are listed in the header row of the table (Step, RepCnt, StepMode, ... , Output4). Scroll to the right to see all parameters.

4. Go to **Shutter** column, click the second entry and type 900, click the third entry and type 800 ... click the 8th entry and type 300.

You have now set up a sequence going from shutter value 1000 ... 300 in steps of 100.

Changing parameters that are part of sequence steps do not change the settings inside the camera immediately, but in case of clicking **Apply Sequence** button.

**Note**

With SmartView do not try out steps altering parameters concerning the transfer via 1394.

Use only steps that do not alter the image format or bandwidth.

5. Click **Apply Sequence** to start the sequence.

The whole list of settings is sent to the camera and the sequence mode is started.  is displayed in the status bar of the viewer window.

6. If you want to disable the current sequence click **Disable Sequence**. If you want to enable the sequence again click **Apply Sequence**.

7. Only Pike: To determine the behavior of the sequence mode with external control additionally to triggering: Go to **I/O** tab and change the Mode of Input 1 or 2 to **SeqStep** or **SeqReset**. For more information see **Pike Technical Manual**, Chapter **Which new sequence mode features are available?**

## **Secure image signature (SIS) (Marlin, Pike, Stingray)**

**Definition** **Secure image signature (SIS)** is the synonym for data, which is inserted into an image to improve or check image integrity.

### **Additional information**

For additional information on the **secure image signature (SIS)** feature read the following chapters:

- **Marlin Technical Manual**, Chapter **Secure image signature (SIS)**
- **Pike Technical Manual**, Chapter **Secure image signature (SIS)**
- **Stingray Technical Manual**, Chapter **Secure image signature (SIS)**

### **Conditions**

- Marlin camera (cycle time, trigger count, frame count)
- Pike camera (additional SIS features compared to Marlin)
- Stingray camera (additional SIS features compared to Marlin)

## Where to find

SmartView: Edit settings → Adv2 tab ([Image stamp & counters](#)  **Enable**)

**Enable and  
configure SIS**

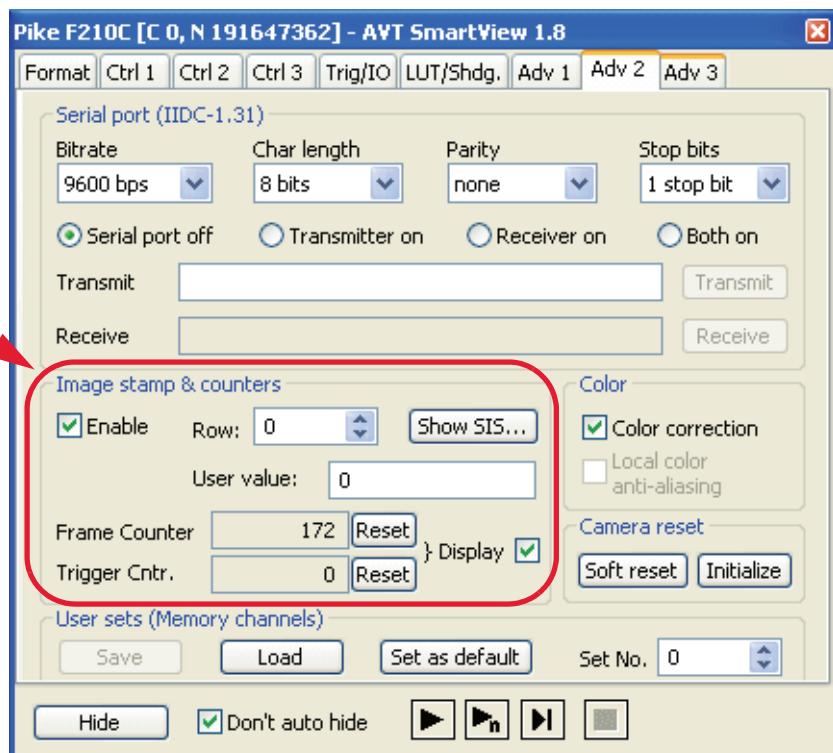

Figure 36: Format tab: Packed 12-bit Mode (Pike F-210C: RAW12)

## Description

To activate secure image signature (SIS) perform the following steps:

1. In SmartView window click **Adv2** tab.
2. In [Image stamp & counters](#) section activate  **Enable** check box.
3. For displaying frame/trigger counter numbers activate **Display**  check box.

For more information see [Secure image signature \(SIS\) & counters](#) on page 54.

## Smear reduction (only Pike)

- Definition** Smear is an undesirable CCD sensor artefact creating a vertical bright line that extends above and below a bright spot in an image.
- Implementation** **Smear reduction** is a new feature of Pike cameras: it is a function implemented in hardware in the camera itself to compensate for smear.

### Additional information

For additional information on the **smear reduction** feature read the following chapter:

- **Pike Technical Manual**, Chapter **Smear reduction**

### Conditions

- Pike camera: Use only if smear appears in your images.

### Where to find

SmartView: Edit settings → Adv3 tab (**Smear reduction**  **Enable**)

Reduce smear

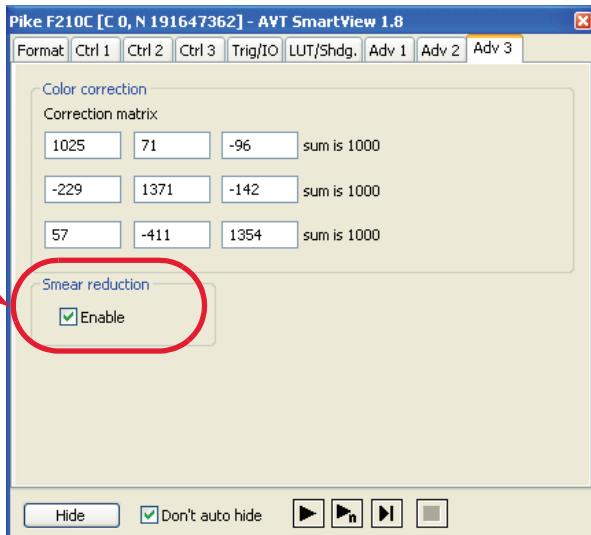

Figure 37: Format tab: Packed 12-bit Mode (Pike F-210C: RAW12)

### Description

Use this function only if smear appears in your images. To activate smear reduction, perform the following steps:

1. In SmartView (Edit settings) window click **Adv3** tab.
2. In **Smear reduction** section activate  **Enable** check box.
